This Civil Engineering Book is one-of-a-kind. This book is structured to raise the level of expertise in Civil Engineering and to improve the competitiveness in the global markets. A civil engineer is someone who applies scientific knowledge to improve infrastructure and common utilities that meet basic human needs. Civil engineers plan, design and manage large construction projects. This could include bridges, buildings,dams, tunnels, buildings, airports, water and sewage systems, transport links and other major structures. They use computer modelling software and data from surveys, tests and maps to create project blueprints. These plans advise contractors on the best course of action and help minimise environmental impact and risk. Buildings and bridges are often the first structures to come to mind, because they are the most obvious engineering creations. But civil engineers are also responsible for less visible creations and contributions. Every time we open a water faucet, we expect water to come out, without thinking that civil engineers made it possible, in many cases by designing systems that transport water to cities from mountain sources that are sometimes hundreds of miles away. Civil engineering is one of the oldest and broadest engineering professions. It focuses on the infrastructure necessary to support a civilized society. The Roman aqueducts, the great European cathedrals, and the earliest metal bridges were built by highly skilled forerunners of the modern civil engineer. These craftsmen of old relied on their intuition, trade skills, and experience-based design rules, or heuristics, derived from years of trial and error experiments but rarely passed on to the next generation. This book of Civil Engineering covers Below Subjects

In contrast, today's civil engineers bring to bear on these problems a knowledge of the physical and natural sciences, mathematics, computational methods, economics, and project management. Civil engineers design and construct buildings, transportation systems (such as roads, tunnels, bridges, railroads, and airports), and facilities to manage and maintain the quality of water resources. Society relies on civil engineers to maintain and advance human health, safety, and our standard of living. Those projects that are vital to a community's survival are often publicly funded to ensure that they get done, even where there is no clear or immediate profit motive.

Property will cost us the earth The science on climate change has been clear for a very long time now. Yet despite decades of appeals, mass street protests, petition campaigns, and peaceful demonstrations, we are still facing a booming fossil fuel industry, rising seas, rising emission levels, and a rising temperature. With the stakes so high, why haven't we moved beyond peaceful protest? In this lyrical manifesto, noted climate scholar (and saboteur of SUV tires and coal mines) Andreas Malm makes an impassioned call for the climate movement to escalate its tactics in the face of ecological collapse. We need, he argues, to force fossil fuel extraction to stop--with our actions, with our bodies, and by defusing and destroying its tools. We need, in short, to start blowing up some oil pipelines. Offering a counter-history of how mass popular change has occurred, from the democratic revolutions overthrowing dictators to the movement against apartheid and for women's suffrage, Malm argues that the strategic acceptance of property destruction and violence has been the only route for revolutionary change. In a braided narrative that moves from the forests of Germany and the streets of London to the deserts of Iraq, Malm offers us an incisive discussion of the politics and ethics of pacifism and violence, democracy and social change, strategy and tactics, and a movement compelled by both the heart and the mind. Here is how we fight in a world on fire.
