The compartmentation of genetic information is a fundamental feature of the eukaryotic cell. The metabolic capacity of a eukaryotic (plant) cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus/cytosol, plastids, and mitochondria. Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism. Although the biological significance of this genetic design has been vividly evident since the discovery of non-Mendelian inheritance by Baur and Correns at the beginning of this century, and became indisputable in principle after Renner's work on interspecific nuclear/plastid hybrids (summarized in his classical article in 1934), studies on the genetics of organelles have long suffered from the lack of respectabil ity. Non-Mendelian inheritance was considered a research sideline~ifnot a freak~by most geneticists, which becomes evident when one consults common textbooks. For instance, these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria, of metabolism and global circulation of the biological key elements C, N, and S, as well as of the organization, maintenance, and function of nuclear genetic information. In contrast, the heredity and molecular biology of organelles are generally treated as an adjunct, and neither goes as far as to describe the impact of the integrated genetic system.

During the 19th century, the engineering of ports and harbours became a large and specialised branch of the profession. This development began in ports in physically difficult locations and may be particularly identified with the growth of the Port of Liverpool. Stimulated by the arrival of ever-larger steamships and the heavy investment in port facilities that they demanded, it spread around much of the world. The opening papers give examples of what could be achieved in antiquity; the following ones set out the advances in design and technology from 1700 to the start of this century - and note some of the failures and recurrent problems. They also illustrate the critical importance of political and economic factors in determining what the engineers achieved.

"Liaquat Ali Khan is one of the unsung heroes of the Pakistan Movement. He became Mohammad Ali Jinnah's most trusted lieutenant, and in 1943 Jinnah called him his 'right hand'. Almost twenty years younger than Jinnah, Liaquat established a closer working relationship with Jinnah than anyone else. Their personal life shared a number of attributes and they both subscribed to modernist views. Jinnah was a Gladstonian liberal, and Liaquat was strongly influenced by the poetry and thoughts of Allama Iqbal. Both had been educated in Law at the Inns of Court in London, and although Jinnah established fame and wealth at the Bar, Liaquat did not practice law. Jinnah chose Liaquat as the General Secretary of the All-India Muslim League in 1936, and over the next decade they worked to establish the League as the political voice of Muslims in South Asia and to create Pakistan. Liaquat's work with the League and in the creation of Pakistan remains largely unappreciated. Liaquat's dedication to the cause of Muslims in India, to serving Mohammad Ali Jinnah and the League are illustrated in the correspondence between these two men and in Liaquat's speeches."--BOOK JACKET.
