Cladistics aims to find groups

that share a unique evolutionary history, and it does not recognize groups that do not. Because the group composed of 3, 4, and 5 contains all of the descendants of their most recent common ancestor, we call that group monophyletic; only monophyletic groups are recognized by cladists.

The best way to begin understanding how cladistics works is to go through an exercise in which you build a phylogeny using a cladogram. To do this we will use the group of hypothetical frogs shown below. This group consists of a defined outgroup (O) and an ingroup of six species (frogs A-F) for which we want to build a cladogram.

The basic idea behind cladistics is that members of a group share a common evolutionary history, and are "closely related," more so to members of the same group than to other organisms. These groups are recognized by sharing unique

features which were not present in distant ancestors.
