Parallel Kinematic Machines (PKMs) are one of the most radical innovations in production equipment. They attempt to combine the dexterity of robots with the accuracy of machine tools to respond to several industrial needs. This book contains the proceedings of the first European-American Forum on Parallel Kinematic Machines, held in Milan, Italy from 31 August - 1 September 1998. The Forum was established to provide institutions, technology suppliers and industrial end users with an improved understanding of the real advantages to be gained from using PKMs. This book contributes to a mid-term strategy oriented to reduce time to market and costs, improve production flexibility and minimize environmental impacts to increase worldwide competitiveness. In particular the authors focus on enabling technologies and emerging concepts for future manufacturing applications of PKMs. Topics include: Current status of PKM R&D in Europe, the USA and Asia. Industrial requirements, roadblocks and application opportunities. Research issues and possibilities. Industrial applications and requirements.

Advances in Product Family and Product Platform Design: Methods & Applications highlights recent advances that have been made to support product family and product platform design along with successful applications in industry. This book provides not only motivation for product family and product platform design (i.e., address questions about “ why and when should we platform ”) but also methods and tools to support the design and development of families of products based on shared platforms (i.e. address the “ how ” and “ what ” questions about platforming). It begins with a general overview of product family design to introduce the general reader to the topic and then progress to more advanced topics and design theory to help designers, engineers, and project managers plan, architect, and implement platform-based product

development strategies for their company. Finally, successful industry applications provide readers and practitioners with case studies and “ talking points ” to become platform advocates and leaders within their organization.

Marketing models is a core component of the marketing discipline. The recent developments in marketing models have been incredibly fast with information technology (e.g., the Internet), online marketing (e-commerce) and customer relationship management (CRM) creating radical changes in the way companies interact with their customers. This has created completely new breeds of marketing models, but major progress has also taken place in existing types of marketing models. *Handbook of Marketing Decision Models* presents the state of the art in marketing decision models. The book deals with new modeling areas, such as customer relationship management, customer value and online marketing, as well as recent developments in other advertising, sales promotions, sales management, and competition are dealt with. New developments are in consumer decision models, models for return on marketing, marketing management support systems, and in special techniques such as time series and neural nets.

EN Corlett Joint-Chairman - COPED, University of Nottingham, Nottingham, UK The contributions offered to this Third National Conference demonstrate that research in production is very much alive. The considerable numbers of papers on robotics, automation and flexible manufacturing systems, together with those in production control and quality matters, demonstrate that there is much work going on in our colleges, polytechnics and universities related to modern methods of manufacture. The future of manufacture undoubtedly hinges on better control. Control over the supply and movement of materials is now keenly sought. Control over manufacturing equipment is also a goal, not just to maintain quality but to give flexibility in sequence and quantity. None of these objectives for improved performance is entirely a technical matter,

although there is an increasing technical ability to influence all of them. To achieve their potential, they depend on competent people at all levels. Discussion with alert managers soon reveals that this is one of their major concerns. Either the people they have require more training, or they cannot hire the people with the abilities they need. This applies at all levels, and the availability of people with competence in manufacture is particularly low.

Introduction to Knowledge Management Wiley

Dimensional metrology is an essential part of modern manufacturing technologies, but the basic theories and measurement methods are no longer sufficient for today's digitized systems. The information exchange between the software components of a dimensional metrology system not only costs a great deal of money, but also causes the entire system to lose data integrity. Information Modeling for Interoperable Dimensional Metrology analyzes interoperability issues in dimensional metrology systems and describes information modeling techniques. It discusses new approaches and data models for solving interoperability problems, as well as introducing process activities, existing and emerging data models, and the key technologies of dimensional metrology systems. Written for researchers in industry and academia, as well as advanced undergraduate and postgraduate students, this book gives both an overview and an in-depth understanding of complete dimensional metrology systems. By covering in detail the theory and main content, techniques, and methods used in dimensional metrology systems, Information Modeling for Interoperable Dimensional Metrology enables readers to solve real-world dimensional measurement problems in modern dimensional metrology practices.
