John Wiley & Sons

Multiresistant bacterial pathogens pose a serious problem worldwide making the appropriate treatment of patients with healthcare-associated infections a challenge. The spread of antibiotic resistance is either mediated by mobile genetic elements (MGEs) or the dissemination of genetically-related groups of pathogens, “ high-risk clonal complexes ” . Interestingly most multiresistant healthcare-associated bacteria command just a few dominant international clonal complexes causing infections in

various geographical areas. It is of utmost importance to identify the determinants associated with and promoting the spread of antibiotic resistance and the dissemination of these multiresistant pathogens. The Topic comprises mostly of population and epidemiological studies investigating antibiotic resistance mechanisms, MGEs and the impact of antibiotic resistance, and the production of virulence factors on the clonal dynamics of a diverse range of bacterial species. Though, the exploration of the mechanisms governing clonal dynamics and the dissemination of antibiotic resistance will remain a salient issue for a considerable time to come we believe that the papers published in the Topic have usefully contributed to the better understanding of some of the processes involved and supplement papers investigating the "non-bacterial" constituents of clonal mobility, like proper medical practice and compliance with hygienic standards.

When is it appropriate to return individual research results to participants? The immense interest in this question has been fostered by the growing movement toward greater transparency and participant engagement in the research enterprise. Yet, the risks of returning individual research results – such as results with unknown validity – and the associated burdens on the research enterprise are competing considerations. Returning Individual Research Results to Participants reviews the current evidence on the benefits, harms, and costs of returning individual research results, while also considering the ethical, social, operational, and regulatory aspects of the practice. This report includes 12 recommendations directed to various stakeholders – investigators, sponsors, research institutions, institutional review boards (IRBs), regulators, and participants – and are designed to help (1) support decision making regarding the return of results on a study-by-study basis, (2) promote high-quality individual research results, (3) foster participant understanding of individual research results, and (4) revise and harmonize current regulations.

Practical Implementation of an Antibiotic Stewardship Program World Scientific

For many years, we have noticed the lack of a concise, yet comprehensive, "question-and-answer style" book that thoroughly covers hematology, hemolymphoid neoplasms, and coagulation disorders and renders them in an easy and digestible manner to the busy hematopathologists and fellows in training. There are many excellent textbooks written by experts in the field, which are indispensable. However, and for sake of board exam cramming, these may not be the preferred source for studying. Most of the available hematology question books are case series-based, and the authors refrain from following or maintaining a board-exam style. Our Hematopathology Q Bank: Board-Style Review will be the first Q bank in the field that

comprehensively covers adult and pediatric disorders in hematology, hematopathology, and coagulation subspecialties. The book falls in eleven chapters and includes 380 written questions (without images), 230 question with high-resolution images, nearly 100 short case series and case studies, and 40 tables, charts, and algorithms. The contents cover both benign (reactive) and neoplastic conditions in hematopoietic and lymphoid systems, hematology-related cytology and FNA challenging cases, flow cytometry, cytogenetics, and molecular genetics. This is in addition to coagulation disorders and some laboratory management. The bank is full of interpretation rules and differential-diagnosis tables and fact sheets for easy board cramming. Materials have been derived from up-to-date textbooks including the revised fourth edition of WHO classification of hematopoietic and lymphoid tumors, articles, and real-time cases encountered in the laboratory. It is our sincere hope that this hematopathology review book fills a gap in field, and that hematopathology fellows in training and attending clinical pathologists find it a wealth of up-to-date information presented in an easy way. We hope they find this "Q bank" of utmost benefit in preparing for exams including both clinical pathology and hematopathology-subspecialty exams.

Veterinary Pharmacology and Therapeutics Elsevier Health Sciences

Historically, the first observation of a transmissible lytic agent that is specifically active against a bacterium (*Bacillus anthracis*) was by a Russian microbiologist Nikolay Gamaleya in 1898. At that time, however, it was too early to make a connection to another discovery made by Dmitri Ivanovsky in 1892 and Martinus Beijerinck in 1898 on a non-bacterial pathogen infecting tobacco plants. Thus the viral world was discovered in two of the three domains of life, and our current understanding is that viruses represent the most abundant biological entities on the planet. The potential of bacteriophages for infection treatment have been recognized after the discoveries by Frederick Twort and Felix d' Hérelle in 1915 and 1917. Subsequent phage therapy developments, however, have been overshadowed by the remarkable success of antibiotics in infection control and treatment, and phage therapy research and development persisted mostly in the former Soviet Union countries, Russia and Georgia, as well as in France and Poland. The dramatic rise of antibiotic resistance and especially of multi-drug resistance among human and animal bacterial pathogens, however, challenged the position of antibiotics as a single most important pillar for infection control and treatment. Thus there is a renewed interest in phage therapy as a possible additive/alternative therapy, especially for the infections that resist routine antibiotic treatment. The basis for the revival of phage therapy is affected by a number of issues that need to be resolved before it can enter the arena, which is traditionally reserved for antibiotics. Probably the most important is the regulatory issue: How should phage therapy be regulated? Similarly to drugs? Then the co-evolving nature of phage-bacterial host relationship will be a major hurdle for the production of consistent phage formulae. Or should we resort to the phage products such as lysins and the corresponding

engineered versions in order to have accurate and consistent delivery doses? We still have very limited knowledge about the pharmacodynamics of phage therapy. More data, obtained in animal models, are necessary to evaluate the phage therapy efficiency compared, for example, to antibiotics. Another aspect is the safety of phage therapy. How do phages interact with the immune system and to what costs, or benefits? What are the risks, in the course of phage therapy, of transduction of undesirable properties such as virulence or antibiotic resistance genes? How frequent is the development of bacterial host resistance during phage therapy? Understanding these and many other aspects of phage therapy, basic and applied, is the main subject of this Topic.
