Did a lab this week testing current and voltage drop using 3 resistors in series, parallel and combination. Resistor values: 146.6, 1132, 3950 ohms. Voltage from power supply: 6V We measured total current through each circuit type and voltage. For series, we measured total current as 1.15 A. For parallel, 45.2 A. For combination, 5.82 A. I am going back through the lab now and am struggling with ...

Transform a combination circuit into a strictly series circuit by replacing (in your mind) the parallel section with a single resistor having a resistance value equal to the equivalent

resistance of the parallel section. Use the Ohm's law equation ($V = I \cdot R$) often and appropriately. Most answers will be determined using this equation. Combo Circuit Lab Answers - Budee

4) Hit the reset all button. Create a combo circuit with at least four resistors. You can include them in any combination of series and parallel that you wish. Include as many ammeters as resistors and a voltmeter. The ammeters should be hooked up to read the current going into each resistor. That is, one ammeter per resistor. Keep the voltage ...

Lab 2: Combinational Circuits 1.

Introduction. Logic circuits for digital systems can generally be classified into two categories. One is combinational logic circuits, the other is sequential logic circuits. A combinational logic circuit consists of logic gates whose outputs at any time are

determined directly from the present combination of inputs without regard to previous inputs.
