A software architect's digest of core practices, pragmatically applied. Designing effective architecture is your best strategy for managing project complexity – and improving your results. But the principles and practices of software architecting – what the authors call the “science of hard decisions” – have been evolving for cloud, mobile, and other shifts. Now fully revised and updated, this book shares

the knowledge and real-world perspectives that enable you to design for success – and deliver more successful solutions. In this fully updated Second Edition, you will: Learn how only a deep understanding of domain can lead to appropriate architecture. Examine domain-driven design in both theory and implementation. Shift your approach to code first, model later – including multilayer architecture. Capture the benefits of prioritizing software

maintainability. See how readability, testability, and extensibility lead to recode quality. Take a user experience (UX) first approach, rather than designing for data. Review patterns for organizing business logic. Use event sourcing and CQRS together to model complex business domains more effectively. Delve inside the persistence layer, including patterns and implementation. Elementary Differential Equations Routledge

This book answers the question of whether we can apply evolutionary theories to our understanding of the development of social structures. Social networks have increasingly become the focus of many social scientists as a way of analyzing these social structures. While many powerful network analytic tools have been developed and applied to a wide range of empirical phenomena, understanding the evolution of social organization still requires theories and analyses of social network evolutionary processes. Researchers from a variety of disciplines have combined their efforts in what is an indication of some very promising future

research and the work represented in this volume provides a basis for a sustained analysis of the evolution of social life. SEC Docket OUP Oxford Given its importance in analysing and influencing the world around us, an understanding of colour is a vital tool in any design process. Colour design provides a comprehensive review of the issues surrounding the use of colour, from the fundamental principles of what colour is to its important applications across a vast range of industries. Part one covers the main principles and theories of

colour, focusing on the human visual system and the psychology of colour perception. Part two goes on to review colour measurement and description, including consideration of international standards, approval methods for textiles and lithographic printing, and colour communication issues. Forecasting colour trends and methods for design enhancement are then discussed in part three along with the history of colour theory, dyes and pigments, and an overview of dye and print techniques. Finally, part four considers the

use of colour across a range of specific applications, from fashion, art and interiors, to food and website design. With its distinguished editor and international team of contributors, *Colour design* is an invaluable reference tool for all those researching or working with colour and design in any capacity. Provides a comprehensive review of the issues surrounding the use of colour in textiles. Discusses the application of colour across a vast range of industries. Chapters cover the theories, measurement and description of colour, forecasting colour

What role does colour play in our built environment? How are our attitudes to colour changing? What potential do new technologies bring for the use of colour and light in architecture? Combining real examples from practice with colour theory, this book will help you to fully understand the role and impact of colour in our urban spaces. Contributions from leading architects Will Alsop, Legorreta and Legorreta, John Outram, Sauerbruch Hutton and Neuterlings Riedijk accompany those from artists

Alain Bony and Yann Kersal é , and from colour researchers such as Kristina Enberg and Anders H å rd, who developed the Natural Colour System. Topics include: how and why we see colour methodologies in the documentation of traditional colours the development of new urban palettes recent colour psychology research the effect of light levels on human behaviour dramatic colour effects achievable with light guidelines for future deployment of colour in the built environment. This is a

sequel to the immensely influential *Colour for Architecture*, published in 1976. Much has changed in 30 years; new cutting edge technologies and materials have emerged allowing architects to experiment with colour and light in an energy efficient and sustainable way, paving the way for a more colourful and exciting built environment.

This volume provides new insights into the functioning of organizational, managerial

and market societies. Multilevel analysis and social network analysis are described and the authors show how they can be combined in developing the theory, methods and empirical applications of the social sciences. This book maps out the development of multilevel reasoning and shows how it can explain behavior, through two different ways of contextualizing it. First, by identifying levels of influence on behavior and different aggregations of actors and behavior, and complex

interactions between context and behavior. Second, by identifying different levels as truly different systems of agency: such levels of agency can be examined separately and jointly since the link between them is affiliation of members of one level to collective actors at the superior level. It is by combining these approaches that this work offers new insights. New case studies and datasets that explore new avenues of theorizing and new applications of methodology are presented. This book will

be useful as a reference work for all social scientists, economists and historians who use network analyses and multilevel statistical analyses. Philosophers interested in the philosophy of science or epistemology will also find this book valuable.

Since the early 1980s there has been an explosion of auditing activity in the United Kingdom and North America. In addition to financial audits there are now medical audits, technology audits, value for

money audits, environmental audits, quality audits, teaching audits, and many others. Why has this happened? What does it mean when a society invests so heavily in an industry of checking and when more and more individuals find themselves subject to formal scrutiny? The Audit Society argues that the rise of auditing has its roots in political demands for accountability and control. At the heart of a new administrative style internal control systems have begun to play an important public role and individual and organizational performance has been increasingly formalized and made auditable. Michael Power argues that the new demands and expectations of audits live uneasily with their operational

capabilities. Not only is the manner in which they produce assurance and accountability open to question but also, by imposing their own values, audits often have unintended and dysfunctional consequences for the audited organization. Top Secret Files Elsevier What are the factors that shape crime and justice policy? Long-term traditions-steeped in politics, ideology, values, ethics, and faith-along with clinical experience have served as the primary guides for policymakers. However, many contemporary scholars, practitioners, and policymakers encourage heavier reliance on scientific research to form crime and justice policy. Along with this

shift toward evidence-based crime prevention, it becomes crucial for practitioners to accurately identify and understand which programs and practices have been the most effective in the past. So relying on systematic reviews of prior research and evaluation is central to the movement toward a more scientific approach to policymaking. The surge of research and evaluation in crime and justice raises a myriad of methodological concerns. This special issue of The ANNALS, which sprang from the Second Annual Jerry Lee Crime Prevention Symposium held at the University of Maryland in April 2002, identifies and addresses those methodological concerns and also presents substantive empirical

outcomes of specific studies. Developed by the Campbell Collaboration Crime and Justice Group, which continues to focus on issues of evidence, this journal provides valuable insights to researchers, practitioners, and policymakers in the promotion and development of an evidence-based approach to crime and justice policy and practice.

This edition of Swokowski's text is truly as its name implies: a classic. Groundbreaking in every way when first published, this book is a simple, straightforward, direct calculus text. It's popularity is directly due to its broad use of

applications, the easy-to-understand exposition, combined with a writing style, and the wealth of examples and exercises which reinforce conceptualization of the subject matter. The author wrote this text with three objectives in mind. The first was to make the book more student-oriented by expanding discussions and providing more examples and figures to help clarify concepts. To further aid students, guidelines for solving problems were added in many sections of the text. The second objective was to stress the usefulness of calculus by means of modern applications of derivatives and integrals. The third objective, to make the text as accurate and error-free as possible, was accomplished by a careful examination of the

thorough checking of each example and exercise.
