The Composite UI Application Block is a source code-based component built on the Microsoft .NET Framework 2.0 that provides proven practices to build complex smart client user interface. It is based on proven design patterns in which rich and complex user interface solutions can be built out of simpler user interface parts that can be independently developed, tested, versioned, and deployed.

[Getting Up and Running with the Composite UI Application ...](#)

I have two very large WinForm applications built on the now dead Composite Application Block ("CAB") from Microsoft Patterns & Practices. I was an earlier adopter and jumped in first to embrace and use CAB. Well, now that it's truly dead I'm starting to think more and more about the future and what framework I can migrate to.

GitHub - EnterpriseLibrary/composite-ui: Composite UI User interface element (UIElement) insert priority is coming soon as an update to the module composite mapper service! Insert priority is set within the XML configuration file specified with a module and provides an end-user control over the ordering of UIElements that are added to the shell through the UI extension site composite mechanism (e.g., menu/toolbar item order

independent of module ...

Developer Roadmap For Building Smart Client Applications

The Microsoft Composite UI Application Block (CAB) is a framework used for creating Model-View-Presenter style windows forms applications. The Smart Client Software Factory (SCSF) streamlines the process of creating these applications by providing us with a powerful base project and a set of menu options for quickly generating modules, views, and events in Visual Studio.
