The American Psychiatric Association Publishing Textbook of Psychopharmacology is an indispensable and comprehensive resource for clinicians and trainees who prescribe psychotropic medications. Updated to reflect the new DSM-5 classification, this revised Fifth Edition maintains the user-friendly structure of its predecessors while offering in-depth coverage of the latest research in pharmacological principles, classes of drugs, and psychiatric disorders. Introductory chapters provide a theoretical grounding in clinical applications, with topics ranging from neurotransmitters to brain imaging in psychopharmacology. The bulk of the book is devoted to various classes of drugs, including antidepressants, anxiolytics, antipsychotics, mood stabilizers, and other agents, with each class divided into chapters on specific drugs -- either new or revised to include the latest findings and trends. Finally, the section on psychopharmacological treatment addresses evidence-based principles of clinical care for the full spectrum of mental disorders and conditions -- from depression to chronic pain -- as well as for specific populations and circumstances -- from children and adolescents to psychiatric emergencies -- offering information on topics such as medication selection, combination and maintenance dosing regimens, monitoring and management of side effects, and strategies for optimizing treatment response. The book's beneficial features are many: The section on principles of pharmacology has been revised and reorganized to incorporate recent discoveries from the fields of neurobiology, genetics, brain imaging, and epidemiology. History and discovery, structure--activity relationships, pharmacological profiles, pharmacokinetics and disposition, mechanisms of action, indications and efficacy, side effects and toxicology, and drug--drug interactions are addressed for each agent. This consistent structure places the desired information at the clinician's fingertips and facilitates study for trainees. Coverage of drugs approved since the last edition is thorough, encompassing new antidepressants (e.g., vortioxetine), new antipsychotics (e.g., cariprazine), and agents on the clinical horizon (e.g., ketamine). More than 180 tables and graphs present critically important data in an accessible way. A work of uncommon scientific rigor and clinical utility, The American Psychiatric Association Publishing Textbook of Psychopharmacology provides state-of-the-art information on both the principles and the practice of psychopharmacological treatment of psychiatric disorders.

Principles and Practice of Psychiatric Nursing, 8th Edition provides comprehensive coverage of psychiatric nursing. Beginning with fundamental coverage of all key psychiatric nursing principles, it goes on to address the complete continuum of care - including mental health promotion and illness prevention, crisis intervention, and psychiatric rehabilitation and recovery. The book then applies psychiatric nursing principles to specific clinical disorders based on adaptive-maladaptive coping responses, the six-step nursing process, and DSM-IV-TR and NANDA diagnoses. Subsequent chapters describe various modalities of treatment (psychopharmacology, somatic therapies, cognitive and behavioral therapies, managing aggressive behavior, and more), hospital-based and community-based care, and treatment of special populations. The Stuart Stress Adaptation Model provides a consistent nursing-oriented framework for understanding health and wellness. Evidence-based algorithms are presented in lieu of the less relevant critical pathways found in other texts. The latest American Nurses Association's Standards of Care prepare students for the realities of evidenced-based care in nursing practice. A vibrant, full-color design enhances and enriches students' understanding of essential concepts. Short vignettes in a patient's and family's own words give readers a different perspective of the caregiving process. Case studies present in-depth clinical scenarios that show each step of the nursing process, demonstrating realistic applications of the nursing process. Critical thinking questions interspersed throughout the text encourage independent clinical reasoning. Numerous boxes and tables throughout the book highlight important issues and current topics related to chapter content in visual, easy-to-digest segments. Citing the Evidence boxes provide summaries of recent clinical research, with new boxes added to the Evolve website each month. Nursing Treatment Plan Summaries present care plans, including patient goals with nursing interventions and rationales, to guide nursing care related to the treatment of major disorders. Patient Education Plans and Family Education Plans include key information nurses need to communicate to the patient and family members. Sample Therapeutic Dialogues for nurse-patient interactions demonstrate the difference between therapeutic and nontherapeutic communication. Clinical chapters have been carefully revised and updated to include the latest research and appropriate nursing and medical diagnoses relevant to each disorder. A strengthened family focus and more in-depth discussion of outpatient care reflect current trends in psychiatric nursing. NIC and NOC are introduced in

the nursing process chapter (chapter 12) and incorporated as appropriate into disorders chapters. Chapter Focus Points at the end of each chapter provide a comprehensive review of important information. Key terms are defined in the glossary and listed with page references at the end of the chapter in which they appear. A comprehensive list of behavioral rating scales is offered as an appendix for easy reference. A companion CD-ROM offers animations, interactive exercises, review questions for the NCLEX examination, and an audio glossary for additional study and review. Assessment Guides, Diagnoses, Psychopharmacology Lippincott Williams & Wilkins
Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to

clinicians on implementing these recommendations to enhance patient care.
