The evolution of the multi-billion-dollar computer services industry, from consulting and programming to data analytics and cloud computing, with case studies of important companies. The computer services industry has worldwide annual revenues of nearly a trillion dollars and employs millions of workers, but is often overshadowed by the hardware and software products industries. In this book, Jeffrey Yost shows how computer services, from consulting and programming to data analytics and cloud computing, have played a crucial role in shaping information technology—in making IT work. Tracing the evolution of the computer services industry from the 1950s to the present, Yost provides case studies of important companies (including IBM, Hewlett Packard, Andersen/Accenture, EDS, Infosys, and others) and profiles of such influential leaders as John Diebold, Ross Perot, and Virginia Rometty. He offers a fundamental reinterpretation of IBM as a supplier of computer services rather than just a producer of hardware, exploring how IBM bundled services with hardware for many years before becoming service-centered in the 1990s. Yost describes the emergence of

companies that offered consulting services, data processing, programming, and systems integration. He examines the development of industry-defining trade associations; facilities management and the firm that invented it, Ross Perot's EDS; time sharing, a precursor of the cloud; IBM's early computer services; and independent contractor brokerages. Finally, he explores developments since the 1980s: the transformations of IBM and Hewlett Packard; the offshoring of enterprises and labor; major Indian IT service providers and the changing geographical deployment of U.S.-based companies; and the paradigm-changing phenomenon of cloud service.

**Directory of Women Business Owners** No Starch Press Strassmann reveals the hidden costs versus value of information technology, including how to realize the alignment of IT and business plans, how spending interacts with revenue, overhead costs, and personnel related to IT, and the idea of workload without payoff. One strategy is outsourcing and the perspective that the best companies do not outsource massive amounts of data manipulation, but rather study good reasons for outsourcing and manage it effectively without decaying their information assets.

Computer Systems 127 Success Secrets - 127 Most Asked Questions on Computer Systems - What You Need to Know

The world of computing got smaller in 1993 in terms of both new ultra-small computing systems and the downsizing of giant computer corporations. Yet for all its shrinkage, the computing industry also reached out in a big way. The new, small computers were equipped with wireless networking systems, and home and office computers were offered the promise of networking with other computers worldwide on a data superhighway. Today, computing is affecting work and leisure alike, increasingly involved in factory and business operations, networking, defence, medicine, education and the domestic environment. Computers and their systems are influencing attitudes to privacy, employment and other social issues. To this effect, the reader must remember that the construction of a system is as complex as a house built in a swamp. It does, therefore, require careful planning and design. Just as a house must have an architect's plan, so does a system. It must have requirements, system objectives and a blueprint.
