This pathophysiology text offers a unique conceptual approach that facilitates learning by viewing pathophysiology as health care professionals do. Students will learn about general mechanisms of disease or alterations in human function—such as immune alterations or altered nutrition—and apply these processes to specific conditions. Chapters focus on fifteen core concepts of altered human function, selected by analyzing and clustering health conditions with high prevalence, incidence, and severity. Unlike a traditional systems-based approach, this novel approach shows how most diseases involve multiple body systems. A bound-in CD-ROM includes animations and an interactive game. Faculty resources include lesson plans, PowerPoint slides, additional case studies, and student assignment worksheets.

There is much attention currently being given to argument-based inquiry in national and state curriculum documents. Students are being required to be able to generate and evaluate science knowledge, and to think critically and judge the value of evidence and explanations. The intent of the book is to provide a rich and broad view of the impact of argument-based inquiry in the elementary classrooms from the perspective of the teacher. All the teachers and professional development authors were engaged in promoting and using argument based inquiry as the approach to teaching science. They were implementing the Science Writing Heuristic (SWH) approach as the argument based approach for classroom practice. As researchers we constantly work to present our views of these experiences with the voice of the teachers only being relayed through the perspective of the researcher. The intent of this book is to provide an opportunity for us as a community to listen to what the teachers are telling us. Importantly as demands are being placed on classroom experiences that provide opportunities for students to pose questions, make claims, and provide evidence, that is, to think critically and reason like scientists, we need to understand what this looks like from the perspective of the teacher. This book brings together a range of elementary teachers from kindergarten

through to year 6 who have used the Science Writing Heuristic approach to teach argument-based inquiry. These teachers have all gone through professional development programs and successfully implemented the approach at a high level.

Education in today's technologically advanced environments makes complex cognitive demands on students pre-learning, during, and post-learning. Not surprisingly, these analytical learning processes--metacognitive processes--have become an important focus of study as new learning technologies are assessed for effectiveness in this area. Rich in theoretical models and empirical data, the International Handbook of Metacognition and Learning Technologies synthesizes current research on this critical topic. This interdisciplinary reference delves deeply into component processes of self-regulated learning (SRL), examining theories and models of metacognition, empirical issues in the study of SRL, and the expanding role of educational technologies in helping students learn. Innovations in multimedia, hypermedia, microworlds, and other platforms are detailed across the domains, so that readers in diverse fields can evaluate the theories, data collection methods, and conclusions. And for the frontline instructor, contributors offer proven strategies for using technologies to benefit students at all levels. For each technology covered, the Handbook: Explains how the technology fosters students' metacognitive or self-regulated learning. Identifies features designed to study or support metacognitive/SRL behaviors. Reviews how its specific theory or model addresses learners' metacognitive/SRL processes. Provides detailed findings on its effectiveness toward learning. Discusses its implications for the design of metacognitive tools. Examines any theoretical, instructional, or other challenges. These leading-edge perspectives make the International Handbook of Metacognition and Learning Technologies a resource of great interest to professionals and researchers in science and math education, classroom teachers, human resource researchers, and industrial and other instructors.
