Convective heat transfer is one of the major types of heat transfer, and convection is also a major mode of mass transfer in fluids. Convective heat and mass transfer takes place both by diffusion – the random Brownian motion of individual particles in the fluid – and by advection, in which matter or heat is transported by the larger-scale motion of currents in the fluid.

What Is Convection? - COMSOL Multiphysics

The velocity of a molecule undergoing mass transfer incorporates both a convective and diffusive component. We understand convection as mass transport due to the average velocity of all molecules, and diffusion as mass transport due to the instantaneously varying, randomized velocity of individual molecules, compared to the average velocity of the fluid as a whole.

Convective Mass Transfer - web2.clarkson.edu

Convective heat transfer, or convection, is the transfer of heat from one place to another by the movement of fluids, a process that is essentially the transfer of heat via mass transfer. Bulk motion of fluid enhances heat transfer in many physical situations, such as (for example) between a solid surface and the fluid.

12.Whichmode heattransfer is the convection heat transfer coefficient usually higher,natural or forced convection ? why ? Convection heat transfer coefficient is usually higher in forced convection than in natural convection, because it mainly depends upon the factors such as fluid density, velocity and viscosity.

correlation of convective heat transfer data, Prandtl (Pr) and Nusselt (Nu) numbers are important. Some of the same parameters, along with some newly defined dimensionless numbers, will be useful in the correlation of convective mass-transfer data. The molecular diffusivities of the three transport process (momentum, heat and mass) have been ...

NPTEL :: Mechanical Engineering - Convective Heat and Mass ...

Heat transfer and mass transfer are kinetic processes that may occur and be studied separately or jointly. Studying them apart is simpler, but both processes are modelled by similar mathematical equations in the case of diffusion and convection (there is no mass-transfer similarity to heat radiation), and it is thus more

HEAT AND MASS TRANSFER - webserver.dmt.upm.es

The convective heat transfer coefficient is dependent upon the physical properties of the fluid and the physical situation. The convective heat transfer coefficient is not a property of the fluid. It is an experimentally determined parameter whose value depends on all the variables influencing convection such as the surface geometry, the nature of fluid motion, the properties of the fluid, and ...
