First published in 1977, this book is a companion volume to *Suffer and Be Still*. It looks at the widening sphere of women's activities in the Victorian age and testifies to the dual nature of the legal and social constraints of the period: on the one hand, the ideal of the perfect lady and the restrictive laws governing marriage and property posed limits to women's independence; on the other hand, some Victorian women chose to live lives of great variety and complexity. By uncovering new data and reinterpreting old, the contributors in this volume debunk some of the myths surrounding the Victorian woman and alter stereotypes on which many of today's social customs are based.

The research interests of the staff of the Fluid Dynamics Research Branch in the general area of vortex flows are summarized. A major factor in the development of enhanced maneuverability and reduced drag by aerodynamic means is the use of effective

vortex control devices. The key to control is the use of emerging computational tools for predicting viscous fluid flow in close coordination with fundamental experiments. In fact, the extremely complex flow fields resulting from numerical solutions to boundary value problems based on the Navier-Stokes equations requires an intimate relationship between computation and experiment. The field of vortex flows is important in so many practical areas that a concerted effort in this area is justified. A brief background of the research activity undertaken is presented, including a proposed classification of the research areas. The classification makes a distinction between issues related to vortex formation and structure, and work on vortex interactions and evolution. Examples of current research results are provided, along with references where available. Based upon the current status of research and planning, speculation on future research directions of the group is also given.
