David Poole's innovative LINEAR ALGEBRA: A MODERN INTRODUCTION, 4e emphasizes a vectors approach and better prepares students to make the transition from computational to theoretical mathematics.

Balancing theory and applications, the book is written in a conversational style and combines a traditional presentation with a

focus on student-centered learning. Theoretical, computational, and applied topics are presented in a flexible yet integrated way. Stressing geometric understanding before computational techniques, vectors and vector geometry are introduced early to help students visualize concepts and develop mathematical maturity for abstract thinking. Additionally, the book includes ample applications drawn from a variety of disciplines, which reinforce the fact that linear algebra is a valuable tool for modeling real-life problems.

In the domain of visual images,

those of fine art form a tiny minority. This original and brilliant book calls upon art historians to look beyond their traditional subjects—painting, drawing, photography, and printmaking—to the vast array of "nonart" images, including those from science, technology, commerce, medicine, music, and archaeology. Such images, James Elkins asserts, can be as rich and expressive as any canonical painting. Using scores of illustrations as

examples, he proposes a radically new way of thinking about visual analysis, one that relies on an object's own internal sense of organization. Elkins begins by demonstrating the arbitrariness of current criteria used by art historians for selecting images for study. He urges scholars to adopt, instead, the far broader criteria of the young field of image studies. After analyzing the philosophic underpinnings of this interdisciplinary field, he surveys

the entire range of images, from calligraphy to mathematical graphs and abstract painting.

Throughout, Elkins blends philosophic analysis with historical detail to produce a startling new sense of such basic terms as pictures, writing, and notation.
