Immediate and high-quality chest compressions (CC) make the background of in-hospital cardiopulmonary resuscitation. The aim of the study is to assess the quality of CC in healthcare providers in the multidisciplinary hospital. Materials and methods. The study was performed in 42 healthcare professionals in Moscow hospital in 2016-2017. Chest compressions were assessed in 2 steps by means of CPR-challenge tool: 2 mins of CC without feedback then 2 mins of CC with feedback on rate, depth and recoil (ZOLL R-series defibrillator). The ERC Guidelines for Resuscitation 2015 were used as reference criteria for CC quality. The analysis was performed using the ZOLL RescueNet Code ReviewR software. Statistical analysis was done by Statistica 7.0 (Mann-Whitney U-test). Data were presented as mean±SD. Difference was considered significant at P

Practice Nurses play an important and pivotal role in healthcare providing a range of interventions and services to patients in General Practice and Primary Care settings. While most Practice Nurses work in GP surgeries and doctor led clinics, others are working as autonomous practitioners in community practices and nurse led centres. Practice Nurses are presented with an ever increasing range of conditions and patient needs as the role is constantly changing and evolving. The extended roles and range of clinical skills which may be provided by a Practice Nurse depend on the needs of the patient and the qualifications, skills, competencies and scope of practice of each individual Practice Nurse (NMBI, 2015). Practice Nurses have a responsibility to ensure that they are suitably qualified, skilled and competent in carrying out each clinical procedure and intervention that they undertake. Developing guidelines for clinical practice is an important part of the Practice Nurse role, but the task of researching, developing and producing guidelines is time-consuming, and it can be difficult to find the information required as and when needed. Practice Nursing: Clinical Guidelines and Procedures in Practice written by a Practice Nurse, and based on local and national guidelines, provides a comprehensive overview and a step by step guide for

nurses carrying out a wide range of clinical procedures in practice. The book contains over 100 clinical guidelines and procedures with illustrations, tables, charts and diagrams. In producing these clinical guidelines, the author hopes that this book will prove useful as a resource and reference guide for other nurses in general practice and primary care settings.

Literature Review from the year 2017 in the subject Medicine - Hospital Environment, Clinical Medicine, grade: 1, Egerton University, language: English, abstract: Over the years, the American Heart Association has made outstanding contributions and numerous improvements to cardiopulmonary resuscitation and advanced cardiac life support guidelines. It is due to adequate use of resources and continuous research that millions of lives are saved in the United States. Such guidelines serve health care providers and other members of the healthcare team as a resource to ensure adequate and timely response to those individuals who experience cardiac or respiratory arrest. However, according to AHA statistics, "More than 326,000 people in the US suffer out-of-hospital cardiac arrests each year. Statistics prove that if more people knew CPR, more lives could be saved" (American Heart Association, 2016). In other words, dissemination of knowledge on the matter has direct outcomes on increasing survival rates. Therefore, the guidelines and the implementation methods are on continuous review based on new evidence. It is important to provide those who suffer cardiac or respiratory arrest with timely services because delays could end up affecting the outcome of those who experience reversible damage. Healthcare providers around the world have become informed on the benefits of updated competence and direct patient outcomes and quality of care. The American Heart Association has published the new 2015 cardiopulmonary resuscitation guidelines, where changes and updates are reflected in an effort to put the best available evidence in practice. The purpose of this review is to compare the 2015 AHA updates with historical evidence in an attempt to explicate the implications and limitations of pharmacology in advanced cardiac life support.

Basic Life Support (BLS) Provider Manual - The content in this handbook is in compliance with the 2020 guidelines for CPR and ECC (Emergency Cardiac Care), recently released by the American Heart Association - therefore, all the protocols illustrated in this book are based on up-to-date evidence. These guidelines are updated every 5 years. The BLS Provider Manual is a complete guide and reference tool that covers all the information students need to know in order to successfully complete the BLS course. For easier learning, multiple-choice questions can be found at the end of each

chapter. The answers to these exercises are found at the very end of the book. Basic Life Support (BLS) refers to a set of procedures that can be learned to prolong survival in life-threatening situations until more professional help is available. Any individual can become certified in basic life support protocols. These protocols are frequently updated, based on the latest evidence available, and every individual who undergoes BLS certification may need to refresh their knowledge every two years. Medical professionals usually have a sound understanding of basic life support protocols. Even then, it is essential for them to frequently undergo certifications to update their knowledge regarding the latest evidence-based protocols. This handbook is designed for both medical professionals and non-healthcare individuals. It aims to establish a sound understanding of the mechanisms underlying basic life support. The intended audience is healthcare students and personnel who need to learn how to perform CPR and other basic cardiovascular life support skills in a wide variety of both clinical and prehospital settings. Purpose of the study  
Cardiopulmonary resuscitation (CPR) training increases knowledge and enhance self-esteem among healthcare professionals (HCP) (1, 2). The knowledge is easily lost, after 12 months the levels are equal to pre-training (3). Despite CPR-training there can be anxiety, hesitation and fear of defibrillation (4). The purpose of this study was to identify the incidence and outcome of in-hospital cardiac arrest (IHCA), furthermore assess the knowledge and attitudes of CPR among HCPs at a minor hospital in Sweden.  
Materials and methods  
The study included all treated IHCA's in 2014 at a minor hospital in Sweden. Data from the Swedish Register of Cardiopulmonary Resuscitation were investigated. Furthermore 211 questionnaires from physicians, nurses and nurse assistants were analysed.  
Results  
The incidence of IHCA was 18 arrests/100 hospital beds/year and the survival rate was 33%. CPR-training was attended by 66%. A majority felt confident and would know what to do in case of an IHCA (Figure 1A). Satisfying self-perceived knowledge and more correct answers was seen among respondents with recent CPR-training. Only 7% of the respondents had all correct answers on the knowledge questions. Being able to defibrillate was strongly agreed by 58% and the skill to lead/give advice to the team was strongly agreed by only 11% (Figure 1B). More years in profession and recent CPR-training (0-6 months ago) were variables associated with confidence in CPR-knowledge

and the ability to lead a resuscitation team (Figure 2A, 2B). Recent CPR-training was associated with the ability to defibrillate (Figure 2A). A long time since CPR-training and few years in profession was associated with anxiety (Figure 2A, 2B).  
Conclusion  
The incidence and survival of IHCA was close to the estimated. A majority felt confident and would know what to do in case of a cardiac arrest but very few respondents believed they had leadership skills. The knowledge was poor.

Heartsaver Pediatric First Aid CPR AED Student Workbook Jones & Bartlett Publishers  
With contributions from over 75 of the foremost experts in the field, the third edition represents the very best in clinical and academic expertise. Taught in leading respiratory care programs in the U.S., it continues to be the top choice for instructors and students alike. The Third Edition includes numerous updates and revisions that provide the best foundational knowledge available as well as new, helpful instructor resources and student learning tools. A complete and up-to-date exploration of the technical and professional aspects of respiratory care. With foundations in evidence-based practice, this essential resource reviews respiratory assessment, respiratory therapeutics, respiratory diseases, basic sciences and their application to respiratory care, the respiratory care profession, and much more. With content cross-references the NBRC examination matrices, *Respiratory Care: Principles and Practice, Third Edition* is the definitive resource for today's successful RT.

Since the late 1950s, revolutionary developments in and the potential future of emergency operations

of basic knowledge, techniques, resuscitation. This meeting was initiated by teaching, and practice of cardiopulmonary James Elam. James Jude, owner of the Wolf Creek Lodge (Blairsville, Georgia 30512), acted resuscitation (CPR) have resulted in the saving of uncountable lives from conditions that as host previously led to certain death. The 1950s The Program Committee invited primarily clinician-scientists from the United States, brought breakthroughs in respiratory resuscitation, the 1960s, breakthroughs in cardiac solicited synopsis papers and pre-distributed resuscitation, and the 1970s have begun to the 37 papers selected to the participants. We were spared formal paper presentations and show breakthroughs in resuscitation of the thus could devote ourselves to two full days arrested brain. Mobilization of large-scale public involve of informal, stimulating, provocative discussion in life-saving efforts is essential. But the success. This led to cross-fertilization of ideas challenges and opportunities of implementing among individuals with different specialty backgrounds.

2015 Handbook of Emergency Cardiovascular Care for Healthcare Providers JP Medical Ltd

Organized for easy reference, this comprehensive, concise, and clinically focused text covers all aspects of emergency medicine. Chapters follow a consistent, structured format—clinical presentation, differential diagnosis, evaluation, management, and disposition with highlighted critical interventions and common pitfalls. In this edition, the Pain and Pain Management section is now at the front of the book, since a large percentage of emergency department patients present with pain-related complaints. The Trauma section now follows the High-Risk Chief Complaint section. A new two-color design will help readers find critical elements of each chapter easily. A companion Website will include the fully searchable text, more than 400 self-assessment questions with answers, and additional images and tables.
