This book, first appearing in German in 2004 under the title *Spezielle Relativitätstheorie für Studienanfänger*, offers access to the special theory of relativity for readers with a background in mathematics and physics comparable to a high school honors degree. All mathematical and physical competence required beyond that level is gradually developed through the book, as more advanced topics are introduced. The full tensor formalism, however, is dispensed with as it would only be a burden for the problems to be dealt with. Eventually, a substantial and comprehensive treatise on special relativity emerges which, with its gray-shaded formulary, is an invaluable reference manual for students and scientists alike. Some crucial results are derived more than once with different approaches: the Lorentz transformation in one spatial direction three times, the Doppler formula four times, the Lorentz transformation in two directions twice; also twice the unification of electric and magnetic forces, the velocity addition formula, as well as the aberration formula. Beginners will be grateful to find several routes to the goal; moreover, for a theory like relativity, it is

of fundamental importance to demonstrate that it is self-contained and without contradictions. Author's website: [www.relativity.ch](http://www.relativity.ch).

**Large Air-cooled Engine Introduction to Analysis**

This engaging introduction to random processes provides students with the critical tools needed to design and evaluate engineering systems that must operate reliably in uncertain environments. A brief review of probability theory and real analysis of deterministic functions sets the stage for understanding random processes, whilst the underlying measure theoretic notions are explained in an intuitive, straightforward style. Students will learn to manage the complexity of randomness through the use of simple classes of random processes, statistical means and correlations, asymptotic analysis, sampling, and effective algorithms. Key topics covered include:

- Calculus of random processes in linear systems
- Kalman and Wiener filtering
- Hidden Markov models for statistical inference
- The estimation maximization (EM) algorithm
- An introduction to martingales and concentration inequalities. Understanding of the key concepts is reinforced through over 100 worked examples and 300 thoroughly tested homework problems (half of which are solved in

detail at the end of the book).

In a lyrical love letter to guide dogs everywhere, a blind poet shares his delightful story of how a guide dog changed his life and helped him discover a newfound appreciation for travel and independence. Stephen Kuusisto was born legally blind—but he was also raised in the 1950s and taught to deny his blindness in order to "pass" as sighted. Stephen attended public school, rode a bike, and read books pressed right up against his nose. As an adult, he coped with his limited vision by becoming a professor in a small college town, memorizing routes for all of the places he needed to be. Then, at the age of thirty-eight, he was laid off. With no other job opportunities in his vicinity, he would have to travel to find work.

This is how he found himself at Guiding Eyes, paired with a Labrador named Corky. In this vivid and lyrical memoir, Stephen Kuusisto recounts how an incredible partnership with a guide dog changed his life and the heart-stopping, wondrous adventure that began for him in midlife. Profound and deeply moving, this is a spiritual journey, the story of discovering that life with a guide dog is both a method and a state of mind.

The combined three volumes of these texts cover traditional linear circuit analysis topics - both concepts and computation - including the use of available software for problem solution where necessary. The text balances emphasis on concepts and calculation so students learn the basic principles and properties that govern circuits behaviour, while they gain a firm understanding of how to solve computational techniques they will face in the world of professional engineers.

*Equilibrium Staged Separations* Pedigree Books Limited  
New York Times bestselling author Patti Callahan Henry delivers a novel that explores the power of lasting love through the connected stories of two women from opposite sides of the sea. Twenty-seven-year-old Kara Larson is bogged down in the stress of planning her elaborate wedding to a professional golfer. Still, to fulfill the requirements of the Palmetto Pointe Junior Society, she makes time in her busy schedule to visit an elderly woman at a nursing home facility. Soon she finds herself mesmerized by the singsong Irish lilt of ninety-six-year-old Maeve Mahoney as Maeve recounts the rambling story of her first love back in Ireland. Or, Kara begins to

wonder, is she really retelling an ancient tale of myth and legend? Waiting for the story to unfold in bits and pieces, and trying to discern the underlying truth, Kara is drawn in—and driven to remember her own first love: childhood neighbor Jack Sullivan. Gradually she realizes that before she embarks on her new life, she must find out how her own story—with Jack—will end. “About all the things that make us worthy as human beings—integrity, honesty, and living the life you are meant to live....A triumph!” —Dorothea Benton Frank “A passionate, unforgettable novel of self-discovery, regret, and the illuminating power of love.” —Mary Alice Monroe

Introducing a NEW addition to our growing library of computer science titles, *Algorithm Design and Applications*, by Michael T. Goodrich & Roberto Tamassia! Algorithms is a course required for all computer science majors, with a strong focus on theoretical topics. Students enter the course after gaining hands-on experience with computers, and are expected to learn how algorithms can be applied to a variety of contexts. This new book integrates application with theory. Goodrich & Tamassia believe that the best way to teach algorithmic topics is to present them in a context that is motivated from applications to uses in society, computer games, computing industry, science, engineering, and the internet. The text teaches students about
