Over twenty years ago, Godine published the first English translation of Georges Perec's masterpiece, Life A User's Manual, hailed by the Times Literary Supplement, Boston Globe, and others as "one of the great novels of the century." We are now proud to announce a newly revised twentieth-anniversary edition of this classic. Structured around a single moment in time - 8:00 PM on June 23, 1975 - Perec's spellbinding puzzle begins in an apartment block in the XVIIth arrondissement of Paris where, chapter by chapter, room by room, the

extraordinarily rich life of its inhabitants is marvelously revealed.

An epic account of the decades-long battle to control what has emerged as the world's most critical resource—microchip technology—with the United States and China increasingly in conflict. You may be surprised to learn that microchips are the new oil—the scarce resource on which the modern world depends. Today, military, economic, and geopolitical power are built on a foundation of computer chips. Virtually everything—from missiles to microwaves—runs on chips, including cars, smartphones, the stock market, even the electric grid. Until recently, America designed and built the fastest chips and maintained its lead as the #1 superpower, but America's edge is in danger of slipping, undermined by players in Taiwan, Korea, and Europe taking over manufacturing. Now, as Chip War reveals, China, which spends more on chips than any other product, is pouring billions into a chip-building initiative to catch up to the US. At stake is America's military superiority and economic prosperity. Economic historian Chris Miller explains how the semiconductor came to play a critical role in modern life and how the U.S. became dominant in chip design and manufacturing and applied this technology to military systems. America's victory in the Cold War and its global military dominance stems from its ability to harness computing power more effectively than any other power. But here, too, China is catching up, with its chip-building ambitions and military modernization going hand in hand. America has let key components of the chip-building process slip out of its grasp, contributing not only to a worldwide chip shortage but also a new Cold War with a superpower adversary that is desperate to bridge the gap. Illuminating, timely, and fascinating, Chip War shows that, to

make sense of the current state of politics, economics, and technology, we must first understand the vital role played by chips.

A dog book for the 99%, The Dog Walker is a hugely entertaining look at the world's greatest job-by an activist who spent a decade as a dog walker for the political class Dog walking: it's every eight-year-old's dream! You spend your day outdoors; you interact exclusively with silly, loving, ridiculous dogs; and you get paid for it. But the reality is . . . well, actually, the reality is pretty great, too, at least according to the anarchist Joshua Stephens's eye-opening account of the dog walker's life. An Anthony Bourdain of the dog walking set, Stephens reports on what every master of the trade—and every informed consumer—needs to know: always keep a spare set of keys, always have references, and never, ever board your beloved pet. But Stephens also goes deeper: he shows us what dog walking reveals about everything from gentrification to street harassment, and why radical empathy must always anchor every interaction—canine or otherwise. Rich with hilarious anecdotes, brilliant observations, and a powerful political conscience, The Dog Walker calls to mind David Rakoff at his most sardonic—if, that is, Rakoff had been an anarchist who walked dogs for a living. An irreverent and perceptive fish-out-of-water story, The Dog Walker is totally irresistible.

Marooned on an alien world isn't something Proxi ever imagined for himself. Yet, that is his reality as the Urbworld drifter is

thrust upon the pristine landscape of a world long since terraformed, and forgotten. Saddled with an eclectic group of fellow survivors, the strangers all managed to escape their rapidly deteriorating transport vessel as it had been passing nearby. A transport vessel that abruptly met its end when it came under siege by a mysterious force wielding impressive weaponry, the likes of which Proxi had never thought possible. No longer strangers, they quickly discover that to survive they need to work together - despite their opinions of each other. Thrust into this new life, now a colonist on the frontier of civilized space, they quickly learn that they must adapt. Each of them must develop existing skills and learn new ones if they're all going to make it off the strange world that is their new home. However, it's not so simple. Threats and dangers are everywhere, the crashlanded survivors are constantly tested, and no one is safe. Will they survive? Will they escape? Or will they fall?

The International Conference on Calorimetry in Particle Physics has become the major forum for state-of-the-art developments of calorimetry techniques. The tenth conference was attended by about 150 physicists from 20 countries and covered

all aspects of calorimetric particle detection and measurements, with emphasis on high energy physics experiments as well as experiments in nuclear physics and astrophysics. The proceedings contain three parts: introductory papers, contributed papers and a summary. The introductory papers start with a historical review of the development of calorimetry technology, and continue with overviews of the current status of calorimetry in high energy physics and astrophysics, which are followed by discussions on calorimetry in future accelerator facilities, such as linear colliders and the Super B Factory. A "hot" technology regarding the "energy flow concept" is also dealt with.

Remote Observing is a new, important, and growing aspect of astronomy. Recent developments in global network communications have made remote observing a viable, and sometimes preferable, alternative to travel to a possibly remote and inhospitable telescope site. This workshop is the first in the world devoted to the topic. The contributors represent many of the world's major telescopes, radio, optical and infrared. The proceedings should become a standard reference for many years on the state of the art in remote control of and data acquisition from astronomical telescopes.
