"An Industrial Product-Service System is characterized by the integrated and mutually determined planning, development, provision and use of product and service shares including its immanent software components in Business-to-Business applications and represents a knowledge-intensive

socio-technical system." - Meier, Roy, Seliger (2010) Since the first conference in 2009, the CIRP International Conference on Industrial Product-Service Systems has become a well-established international forum for the review and discussion of advances, research results and industrial improvements. Researchers from all over the world have met at previous IPS2 conferences in Cranfield (2009), Linköping (2010), Braunschweig (2011) and Tokyo (2012). In 2013, the 5th CIRP International Conference on Industrial Product-Service Systems is held in Bochum. Important topics of IPS2 research presented at the conference are: planning and development, sustainability,

business models, operation, service engineering, knowledge management, ICT, modeling and simulation, marketing and economic aspects as well as the role of the human in IPS2.

Managing Projects Macmillan

The subject of this book is the nested partitions method (NP), a relatively new optimization method that has been found to be very effective solving discrete optimization problems. Such discrete problems are common in many practical applications and the NP method is thus useful in diverse application areas. It can be applied to both operational and planning problems and has been demonstrated to effectively solve complex problems in both manufacturing and service industries. To illustrate its broad applicability and effectiveness, in this book we will show how the NP method has been successful in solving complex problems in planning and scheduling, logistics and transportation, supply chain design, data mining, and health care. All of these diverse applications have one characteristic in common: they all lead to complex large-scale discrete optimization problems that are intractable using traditional optimization methods.

1.1 Large-Scale Optimization

In developing the NP method we will consider optimization problems that can be stated mathematically in the following generic form: $\min_{x \in X} f(x)$ where the solution space or feasible region X is either a discrete or bounded set of feasible solutions. We denote a solution to this problem x and the objective function value $f = f(x)$.

The Fundamentals of Developing Operational Solutions for the Government guides professionals on how to use operations research to solve problems and capture opportunities for government customers. The governments of modern democratic nations manage large complex societal operations to offer national defense, social services, infrastructure sustainment, law enforcement, monetary control, and other benefits for their citizens. The United States government alone spends over \$1 trillion per year on these discretionary activities. Within all the spending, deliveries, and oversight, some operational needs require solutions to improve processes, architectures, technologies, and human factors. Without such effective and comprehensive solutions, the most eloquent proposal for government work could end in defeat and the most well-funded government programs could yield operational disruptions and performance failures. There are many

books on how to write winning proposals to the government, but this book places winning in the context of deeply understanding government operations and innovatively solving government problems. There are also some books on convincing the government to adopt new transformational processes, but this book seeks to first try to fix current government processes before demanding risky transformation. Finally, there are massive tomes dedicated to the theories and mathematical models of operations research, but this book is devoted to making operations research simple enough for professionals to apply throughout the course of developing proposals and delivering products and services. Presenting the methods and techniques for quickly developing solutions is thus the central focus.

Compound Solutions Macmillan

Claiming 1.5 million lives in 2015, tuberculosis is the world's most deadly infectious disease. Because of the population it overwhelmingly affects, however, pharmaceutical companies are uninterested in developing better drugs for the disease. Compound Solutions examines Product Development Partnerships (PDPs), which arose early in the twenty-first century to develop new drugs and vaccines for infectious diseases in low-income countries. Here, for the first time, is a sustained examination of PDPs:

the work they do, the partnerships they form, their mission, and their underlying philosophy of addressing global health needs—with implications that extend well beyond tuberculosis. Focusing on two PDPs for tuberculosis—the Global Alliance for TB Drug Development (TB Alliance) and Aeras (a nonprofit focused on vaccine development)—Susan Craddock argues that PDPs do much more than product development. As innovative sites of humanitarian pharmaceutical production, they are contravening mainstream pharmaceutical production by tying drug and vaccine research to global health needs rather than shareholder demand. In largely untethering the profit incentive from pharmaceutical production, Craddock shows, PDPs exhibit more creative and efficient scientific practices, reshaping regulatory norms and implementing more ethical forms of clinical trials that enhance community engagement and capacity building. An unparalleled, interdisciplinary analysis of PDPs as politically, socially, scientifically, and economically innovative sites of pharmaceutical production, *Compound Solutions* is a must for readers in the fields of public health, science and technology studies, and medical social

science.
