This book is based around the author's beautiful and sometimes awe-inspiring color images and mosaics of deep-sky objects. The book describes how similar "Hubble class" images can be created by amateur astronomers in their back garden using commercially available telescopes and CCD cameras. Subsequent processing and image enhancement in the "electronic darkroom" is covered in detail as well. A range of telescopes and equipment is considered, from the author's 11-inch with Hyperstar camera, down to more affordable instruments. Appendices provide links to free software

– not available from a single source – and are themselves an invaluable resource. Adobe Creative Suite 3 Bible Jones & Bartlett Learning Communications will play a central role in the computer applications of the next decade. The core of these applications is asynchronous serial communication. This book includes both theoretical and practical discussions of this topic, allowing programmers and technically advanced users to build their own C programming library of functions for serial communications. Camera Raw, using the improved Photomerge command (that aligns and blends layers automatically) to stitch together images, making selections using the new Quick Selection tool and Refine Edge feature, and Smart Filters are all covered. Both beginning users, who want a thorough introduction to the topic, and more advanced users, who are looking for a handy reference, will find what they need here. In this edition, using a fresh new design and now illustrated in full color, the authors have streamlined the text by focusing on the most efficient means of

accomplishing a task, rather than explaining all possible methods. By the end of the book, users will have a solid foundation for working in Photoshop CS3.
