In July 2010, the National Research Council (NRC) appointed the Committee to Review the 21st Century Truck Partnership, Phase 2, to conduct an independent review of the 21st Century Truck Partnership (21CTP). The

21CTP is a cooperative research and development (R&D) partnership including four federal agencies-the U.S. Department of Energy (DOE), U.S. Department of Transportation (DOT), U.S. Department of Defense (DOD), and the U.S. Environmental Protection Agency (EPA)-and 15 industrial partners. The purpose of this Partnership is to reduce fuel consumption and emissions, increase heavy-duty vehicle safety, and support research, development, and demonstration to initiate commercially viable products and systems. This is the NRC's second report on the topic and it includes the committee's review of the Partnership as a whole, its major areas of focus, 21CTP's management and priority setting, efficient operations, and the new SuperTruck program.

After 1945 many countries needed new vehicles in order to replace those that had been destroyed or worn out in the war and so British factories were offered incentives to produce and export lorries. Foden were one such company to take advantage of the opportunities available and in the 1950s, had agents in almost every West European country. In the 1970s when the European market had declined, the Middle East, Australia and South Africa markets rose to prominence and from the 1980s onwards, New Zealand became the primary destination for the

marque. By the time production finally ceased in 2006, they had sold vehicles all over the world. The vehicles produced for export differed greatly from the designs used in Britain. In many countries the gross weights of vehicles exceeded the British values significantly, so the majority of Foden export vehicles had much stronger chassis, gearboxes, axles, suspensions and more powerful engines than their British counterparts. Many also had tropical double roofs to keep the heat out and sleeper cabs, long before they became common in the UK. This comprehensive book detailing the lorries that Foden exported around the world, follows on from the publication of the author's first book about the Fodens produced and used within the UK (*Foden Special Vehicles*). It includes 364 fascinating photographs, many of which have never been previously published and will be of interest to all Foden fans and transport enthusiasts in general.

The high-pressure direct-injection (HPDI) of natural gas in a compression ignition engine has the potential to reduce demand for petroleum derived fuels and significantly reduce the level of pollutants and greenhouse gases emitted from heavy duty transport vehicles. A new HPDI injector was tested where diesel is injected into a gas/diesel reservoir in the injector and the diesel and gas are then co-injected into the combustion chamber. In order to identify interactions between the diesel and gas in the reservoir, two

different injector geometries were tested: prototypes A and B. Prototype B had reduced reservoir volume to increase gas velocity inside the injector. A majority of the tests were conducted in a single-cylinder test engine derived from a Cummins ISX diesel engine. As prototype A was being modified to create Prototype B this test engine was moved to a larger test cell. After updating the electrical, mechanical, and safety systems, the test engine in the new test cell was found to run repeatably; however, emissions comparisons between both test cells was not possible due to different analyzers being used. Single gas and double gas injections were conducted for both injector prototypes. The single gas injection tests found that increasing the diesel injection mass reduced the mass of gas injected. Increased diesel injection mass also shortened ignition delay, reduced unburned and partially burned fuel and increased NOx emissions. Holding the diesel injection mass constant and reducing the gas injection mass had the same effect as increasing diesel on ignition delay and gaseous emissions. If the diesel injection mass was kept constant and a second gas injection was added, the heat release due to the first injection decreased and the start of combustion was retarded. This appears to have occurred because some of the diesel was carried into the cylinder by the second injection and less

diesel was available in the first injection to promote ignition. Double gas.

Medium- and heavy-duty trucks, motor coaches, and transit buses - collectively, "medium- and heavy-duty vehicles", or MHDVs - are used in every sector of the economy. The fuel consumption and

greenhouse gas emissions of MHDVs have become a focus of legislative and regulatory action in the past few years. This study is a follow-on to the National Research Council's 2010 report, *Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles*. That report provided a series of findings and recommendations on the development of regulations for reducing fuel consumption of MHDVs. On September 15, 2011, NHTSA and EPA finalized joint Phase I rules to establish a comprehensive Heavy-Duty National Program to reduce greenhouse gas emissions and fuel consumption for on-road medium- and heavy-duty vehicles. As NHTSA and EPA began working on a second round of standards, the National Academies issued another report, *Reducing the Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two: First Report*, providing recommendations for the Phase II standards. This third and final report focuses on a possible third phase of regulations to be promulgated by these agencies in the next decade. *Reducing Fuel Consumption and Greenhouse Gas Emissions of Medium- and Heavy-Duty Vehicles, Phase Two* CarTech Inc

The effect of particulate matter on the climate depends on its scattering properties (influenced by morphology) and refractive index (dependent on microstructure). The morphology and microstructure of particulates from two different engines were studied. The first set of soot samples was collected from a 1.9L Volkswagen Turbo Direct Injection engine with or without a catalytic

converter, using two different fuel types (ULSD and B20) and six speed/load combinations. The second set of the samples was taken from a Cummins ISX heavy-duty engine using the Westport pilot-ignited direct injection natural-gas fuelling system for three different speed/load combinations. The soot morphology was investigated using transmission electron microscopy (TEM), emphasizing the fractal properties. A Matlab-based image processor was used to extract geometrical properties of soot. Thirty-five aggregates were analyzed for each sample. The fractal dimensions ( $D_f$ ) were computed using the aggregate dimension and pair correlation methods. For the soot collected from VW engine, it was found that fuel type (ULSD) and B20) and the presence of a catalytic converter did not affect the fractal dimensions of soot aggregates, while engine load conditions had slight influence on  $D_f$ . At constant engine RPM, fractal dimensions started to decline as the engine torque was significantly increased. For the soot produced by the natural gas engine, similar changes in the fractal dimension with respect to the engine load were also observed. Both methods of computing  $D_f$  produced similar trends. Raman spectroscopy was used to quantify the degree of structural disorder present in soot. The Raman spectral analysis was done using two-band ("G" at  $\sim 1578$  and "D"  $\sim 1340$   $\text{cm}^{-1}$ ) and five-band (U, DI, D2, D3, D4 at about 1580, 1350, 1500, 1620 and 1200  $\text{cm}^{-1}$  respectively) combinations. For the soot sampled from VW engine, the results from both methods showed that B20 soot exhibited much greater structural disorder and t.

In conjunction with the 50th anniversary of the creation of the Environmental Protection Agency, this book brings together leading scholars and EPA veterans to provide a comprehensive assessment of the agency's key decisions and actions in the various areas of its responsibility. Themes across all chapters include the role of rulemaking, negotiation/compromise, partisan polarization, judicial impacts, relations with the White House and Congress, public opinion, interest group pressures, environmental enforcement, environmental justice, risk assessment, and interagency conflict. As no other book on the market currently discusses EPA with this focus or scope, the authors have set out to provide a comprehensive analysis of the agency's rich 50-year history for academics, students, professional, and the environmental community.

The 21st Century Truck Partnership (21CTP), a cooperative research and development partnership formed by four federal agencies with 15 industrial partners, was launched in the year 2000 with high hopes that it would dramatically advance the technologies used in trucks and buses, yielding a cleaner, safer, more efficient generation of vehicles.

Review of the 21st Century Truck Partnership critically examines and comments on the overall adequacy and balance of the 21CTP. The book reviews how well the program has accomplished its goals, evaluates progress in the program, and makes recommendations to improve the likelihood of the Partnership meeting its goals. Key recommendations of the book include that the 21CTP should be continued, but the future program should be revised and better balanced. A clearer goal setting strategy should be developed, and the goals should be clearly stated in measurable engineering terms and reviewed periodically so as to be based on the available funds.
