The ideal? Newly minted high school graduates all across the nation, each one a complex text genius, a writer and analytic thinker beyond compare. All on to glorious colleges and careers, thanks to the Common Core. The reality? The 1.3 million students who fail to graduate from high school each year and the hundreds of thousands more who either gave up or lost interest long ago . . . The reality is why Common Core CPR is needed. Urgently. Because if we continue to insist that all students meet expectations that are well beyond their abilities and mindsets, these kids will only decline faster. We must be brave enough-and trained enough-to cast aside what we know harms students and apply with renewed vigor the teaching methods we know work. Releah Lent and Barry Gilmore rise to the challenge, and there are no two authors better equipped to do so. They embrace what is best about the standards-their emphasis on active, authentic learning-and then explicitly show teachers how to

connect these ideal outcomes to practical classroom strategies, detailing the day-to-day teaching that can coax reluctant learners into engagement and achievement. You'll learn how to: Consider choice and relevance in every assignment Plan and spot opportunities for success Scaffold students' comprehension of complex fiction and nonfiction texts Model close reading through thoughtful questioning Teach students to use evidence in reading, writing, speaking, and reflection . . . And so much more It's not the big sweeping formulas for achievement that will win the day; it's the incremental growth that teachers need to make happen: that one book, that one writing assignment, to help a student turn a corner. "If we can get that one transformational moment to occur, and follow it up by designing more opportunities for success, that's the ideal," say Lent and Gilmore.

Over 5,300 total pages MARINE RECON Reconnaissance units are the commander's eyes and ears on the battlefield. They are task organized as a highly trained six man team capable of conducting specific missions behind enemy lines. Employed as part of the Marine Air-Ground Task Force, reconnaissance teams provide timely information to the supported commander to shape and influence the battlefield. The varying types of missions a Reconnaissance team conduct depends on how deep in the battle space they are operating. Division Reconnaissance units support the close and distant battlespace, while Force Reconnaissance units conduct deep reconnaissance in support of a landing force. Common missions include, but are not limited to: Plan, coordinate, and conduct amphibious-ground reconnaissance and surveillance to observe, identify, and report enemy activity, and collect other information of military significance. Conduct specialized surveying to include: underwater reconnaissance and/or demolitions, beach permeability and topography, routes, bridges, structures, urban/rural areas, helicopter landing zones (LZ), parachute drop zones (DZ), aircraft forward operating sites, and mechanized reconnaissance missions. When properly task organized with other forces, equipment or personnel, assist in specialized engineer, radio, and other special reconnaissance missions. Infiltrate mission areas by necessary means to include: surface, subsurface and airborne operations. Conduct Initial Terminal Guidance (ITG) for helicopters, landing craft, parachutists, air-delivery, and re-supply. Designate and engage selected targets with organic weapons and force fires to support battlespace shaping. This includes designation and terminal guidance of precision-guided munitions. Sudden cardiac death is a global health threat for which we have only partial answers. With growing elucidation of the underlying pathophysiological mechanisms of sudden cardiac death, better patient identification and treatment options are being developed. These include risk stratification paradigms, ICD therapy, pharmacological options, ablative procedures, and other treatments. This book covers many of these options, including defibrillator technology and clinical applications. It also examines pathophysiological pathways and etiologies as well as highlights risk-stratification in ion channel diseases and structural heart disease such as dilated cardiomyopathy.

This book investigates how ethics generally precedes legal regulation, and looks at how changes in codes of ethics represent an unparalleled window into the research, innovation, and emerging technologies they seek to regulate. It provides case studies from the fields of engineering, science, medicine and social science showing how professional codes of ethics often predate regulation and help shape the ethical use of emerging technologies and professional practice. Changes in professional ethics are the crystallization of ongoing conversation in scientific and professional fields about how justice, privacy, safety and human rights should be realized in practice where the law is currently silent. This book is a significant addition to this area of practical and professional ethics and is of particular interest to practitioners, scholars, and students interested in the areas of practical and applied ethics.

Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. *Strategies to Improve Cardiac Arrest Survival* examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of *Strategies to Improve Cardiac Arrest Survival* provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Safe Passage: Astronaut Care for Exploration Missions sets forth a vision for space medicine as it applies to deep space voyage. As space missions increase in duration from months to years and extend well beyond Earth's orbit, so will the attendant risks of working in these extreme and isolated environmental conditions. Hazards to astronaut health range from greater radiation exposure and loss of bone and muscle density to intensified psychological stress from living with others in a confined space. Going beyond the body of biomedical research, the report examines existing space medicine clinical and behavioral research and health care data and the policies attendant to them. It describes why not enough is known today about the dangers of prolonged travel to enable humans to venture into deep space in a safe and sane manner. The report makes a number of recommendations concerning NASA's structure for clinical and behavioral research, on the need for a comprehensive astronaut health care system and on an approach to communicating health and safety risks to astronauts, their families, and the public.
