Pancreatitis may be acute or chronic. Although they can be caused by similar aetiologies, they tend to follow distinct natural histories. Around 80% of acute pancreatitis (AP) diagnoses occur as secondary to gallstone disease and

alcohol misuse. This disease is commonly associated with the sudden onset of upper abdominal that is usually severe enough to warrant the patient seeking urgent medical attention. Overall, 10 to 25% of AP episodes are classified as severe, leading to an associated mortality rate of 7 to 30%. Treatment is conservative and consists of general medical support performed by experienced teams, sometimes in ICUs. Although most cases of acute pancreatitis are uncomplicated and resolve spontaneously, the presence of complications has significant prognostic importance. Necrosis, hemorrhage, and infection convey rates of up to 25%, 50%, and 80% mortality, respectively. Other complications such as pseudocyst formation, pseudoaneurysm formation, or venous thrombosis increase morbidity and mortality to a lesser degree. The presence of

pancreatic infection must be avoided.

The concept for this book evolved over many years of intense clinical practice during which a wide variety of vascular complications were encountered as a result of other surgical or interventional procedures. In this book, the authors describe cohesive efforts by experts in the field as they commit to advancing health care quality by all professionals. It should be noted at the outset that the book does not discuss various non-vascular or systemic complications of patients undergoing vascular interventions such as myocardial infarction, renal or respiratory failure. Instead, the content is divided into four separate sections. The material begins with an introduction to vascular anatomy and function. There follows a section addressing specific complications of the vascular system that can occur in any patient, sometimes even without intervention. The third section addresses complications specific to interventions and surgical procedures. The final section is dedicated to the delayed and long-term sequelae attributable to the most commonly encountered vascular complications.

Vascular Complications of Surgery and Intervention: A

Practical Guide is targeted towards dedicated health care professionals managing patients affected by inadvertent but potentially disastrous vascular complications and for those practitioners performing interventions either directly upon the vascular system or procedures that have potential for collateral impact.

This text provides the reader a starting point for the most difficult and uncommon complications in acute care surgery. It is designed to provide options to that ubiquitous intra-operative or bedside question “ Well, now what do we do with this? ” The topics have been chosen for the extreme difficulty of management and the surprising regularity that they present and the lack of large volume of accumulated evidence, where expert experience remains vital. The volume editors present a list of clinical scenario ’ s, intra-operative findings, and ethical circumstances that few general surgeons in their career will see in their career. The authors represent the most prolific surgeons in practice today. They present how they would manage these challenging acute care surgery problems based on their vast clinical experience. Here, these surgeons share their personal experience with the most difficult cases. The text is divided into 4 parts. The first part is “ Global Patient Issues ” when a singular surgical problem presents itself in a very complicated patient with an extensive list of unstable co-morbid diseases. The second part is “ Specific Disease Issues ” This is a surgical text and as such each issue is an unexpected intra-operative finding and expert management. The third part is “ Post-Operative Issues ” and as any seasoned surgeon knows, is the most critical part of managing a complicated surgical case. The last section is “ Challenging Ethical Scenarios. ” The text is designed to provide the surgeon in

training or the seasoned general surgeon unique clinical or operative options for the care of their patients.
