Mobile phone forensics is the science of recovering digital evidence from a mobile phone under forensically sound conditions using accepted methods. Mobile phones, especially those with advanced capabilities, are a relatively recent phenomenon, not usually covered in classical computer forensics. This guide attempts to bridge that gap by providing an in-depth look into mobile phones and explaining the technologies involved and their relationship to forensic procedures. It covers phones with features beyond simple voice communication and text messaging and their technical and operating characteristics. This guide also discusses procedures for the preservation, acquisition, examination, analysis, and reporting of digital information present on cell phones, as well as available forensic software tools that support those activities.

Deaths in hospital often  
occur within 24 hours of  
admission. Many of these  
deaths could be prevented if

very sick children are identified soon after their arrival in the health facility and treatment is started immediately. Therefore, a process of rapid triage for all children presenting to hospital needs to be put in place to determine whether any emergency or priority signs are present. This 3 1/2-day training course builds on the WHO Emergency Triage Assessment and Treatment (ETAT) guidelines as contained in the Pocket book of hospital care for children . It provides participants with the reading materials to prepare themselves for the modules taught in the course. Guidance on how to conduct the training is contained in the parallel facilitator's guide. This training course can be included in a quality
