Nasal continuous positive airway pressure ventilation is the gold standard in the treatment of obstructive sleep apnea. Long-term compliance rates are about 60%. Therefore, several alternative treatment options are of special interest. Beside conservative therapies, various surgical concepts exist. The field of surgery for sleep disordered breathing has rapidly grown with new instrumentation and surgical

techniques in the last 10 years. Surgeons in these fields have to attend scientific meetings, participate in workshops, and read the literature to stay up to date. In our sleep laboratories we conduct 30 polysomnographies each night. Each year, we perform almost 1,000 surgical procedures for sleep disordered breathing apart from numerous other conservative and apparative treatment modalities. Referring to our expe- ence and the present literature, we tried to give new information on surgical techniques in this second edition. The chapters are grouped in different anatomical fields of interest. We wanted to give general advice and specific new hints for the surgery of sleep disordered breathing so that the reader learns basic techniques followed by more advanced surgery. In addition to the illustrated surgical descriptions, the chapters contain informations about indications and contraindications of each surgical procedure and the postoperative care. Special interest has been dedicated to evidence-based medicine. So in each chapter, there is a table of references summarizing the effectiveness of the procedure and EBM grade.

Hand, foot and mouth disease (HFMD) is a common infectious disease caused by a group of enteroviruses, including coxsackievirus A16 (CA16) and enterovirus 71 (EV71). Over the last decade, many outbreaks of HFMD have been reported in countries of the Western

Pacific Region. HFMD caused by EV71 is of particular concern because of the increased number of deaths associated with infection. Until now, there has been little guidance on HFMD caused by EV71. This publication provides practical support for the treatment, prevention and control of HFMD based on the most recent scientific literature and the current understanding and experiences of international experts. It is intended as a resource for both clinicians working with HFMD cases on a regular basis and for public health personnel who are responsible for preventing and responding to outbreaks of HFMD.

Deaths in hospital often occur within 24 hours of admission. Many of these deaths could be prevented if very sick children are identified soon after their arrival in the health facility and treatment is started immediately. Therefore, a process of rapid triage for all children presenting to hospital needs to be put in place to determine whether any emergency or priority signs are present. This 3 1/2-day training course builds on the WHO Emergency Triage Assessment and Treatment (ETAT) guidelines as contained in the Pocket book of hospital care for children . It provides participants with the reading materials to prepare themselves for the modules taught in the course. Guidance on how to conduct the training

is contained in the parallel facilitator's guide. This training course can be included in a quality improvement process, which targets the whole hospital or it can start such a process. Practical Phonetics and Phonology Springer Science & Business Media

"Hypoxaemia is a major contributor to child deaths that occur worldwide each year; for a child with pneumonia hypoxaemia increases the risk of death by up to 5 times. Despite its importance in virtually all types of acute severe illness, hypoxaemia is often not well recognized or well managed more so in settings where resources are limited. Oxygen therapy remains an inaccessible luxury for a large proportion of severely ill children admitted to hospitals in developing countries. This is particularly true for patients in small district hospitals, where, even if some facility for delivering oxygen is available, supplies are often unreliable and the benefits of treatment may be diminished by poorly maintained, inappropriate equipment or poorly trained staff with inadequate guidelines. Increasing awareness of these problems is likely to have considerable clinical and public health benefits in the care of severely ill children. Health workers

should be able to know the clinical signs that suggest the presence of hypoxaemia and have more reliable means of detection of hypoxaemia. This be achieved through more widespread use of pulse oximetry, which is a non-invasive measure of arterial oxygen saturation. At the same time oxygen therapy must be more widely available; in many remote settings, this can be achieved by use of oxygen concentrators, which can run on regular or alternative sources of power. Having effective systems for the detection and management of hypoxaemia are vital in reducing mortality from pneumonia and other severe acute illnesses. Oxygen therapy is essential to counter hypoxaemia and many a times is the difference between life and death. This manual focuses on the availability and clinical use of oxygen therapy in children in health facilities by providing the practical aspects for health workers, biomedical engineers, and administrators. It addresses the need for appropriate detection of hypoxaemia, use of pulse oximetry, clinical use of oxygen and delivery systems and monitoring of patients on oxygen therapy. In addition, the manual addresses practical use of pulse oximetry, and oxygen concentrators and cylinders in an effort to improve oxygen systems
