With its fourth season due to air in January 2008, the award-winning *Battlestar Galactica* continues to be exceptionally popular for non-network television, combining the familiar features of science fiction with direct commentary on life in mainstream America. *Cylons in America* is the first collection of critical studies of *Battlestar Galactica* (its 2003 miniseries, and the ongoing 2004 television series), examining its place within popular culture and its engagement with contemporary American

society. *Battlestar Galactica* depicts the remnants of the human race fleeing across space from a robotic enemy called the Cylons. The fleet is protected by a single warship, the *Battlestar*, and is searching for a "lost colony" that settled on the legendary planet "Earth." Originally a television series in the 1970s, the current series maintains the mythic sense established with the earlier quest narrative, but adds elements of hard science and aggressive engagement with post-9/11 American politics. *Cylons In America* casts a critical eye on the revived series and is sure to appeal to fans of the show, as well as to scholars and researchers of contemporary television.

A computer network is a digital telecommunications network. It

involves computing devices that exchange data with each other using connections between nodes. Wireless media such as Wi-Fi or cable media like optic cables or wires are used to establish these data links. Interpersonal communications are facilitated by computer networks, which allow users to communicate easily and efficiently through different means. Shared use of application and storage servers, use of email and instant messaging, access to the World Wide Web, etc. are some of the applications and services supported by computer networks. The wired technologies used for networking include coaxial cable, optical fiber and twisted pair cabling. The wireless technologies include terrestrial microwave communication, radio and spread spectrum technologies, communication satellites and free-space optical communication. This book studies, analyzes and upholds the pillars of computer networks and communication and its utmost significance in modern times. It is a valuable compilation of topics, ranging from the basic to the most complex advancements in this field of study. It will help new researchers by foregrounding their knowledge in this branch.

Recent technological advances in telecommunications, electronics, security, automation, and building control systems create many new challenges for workplace designers. The "workplace of the future" must accommodate these new technologies and changing work styles in appropriate physical, environmental, and organizational settings to enhance worker speed, communication, and overall productivity. The Advanced Building Systems Integration Consortium, an industry-university partnership established at Carnegie Mellon University, is dedicated to researching and developing the quality of the workplace through the innovative use of advanced technologies. This important work reports on the

major findings of the multidisciplinary field team in the study of a few key Japanese office buildings. The authors focus on a selected set of design features - components and integrated systems - that herald innovative future trends and stand the test of occupancy evaluation. Designing the Office of the Future provides the general approach of the Advanced Building Systems Integration Consortium (ABSIC) to the building studies and their use towards the development of advanced products and workplaces. The book reports generalized findings from the international building studies in four countries, explains the intellectual framework of the team's approach to defining advanced workplaces, and presents the details of the actual building evaluation process. The book then presents an overview of Japanese trends drawn from the in-depth building studies and other building visits, as well as critical readings and discussions with Japanese leaders in intelligent building design. Other topics covered include theselection of innovative components, systems, and processes identified by the multidisciplinary team in four Japanese buildings - Toshiba Headquarters, NTT Twins Regional Headquarters, the ARK Mori Building, and the Umeda Center building. Designing the Office of the Future then discusses new developments in building design technology, and concludes with a list of major design changes to be introduced into the technologically advanced workplace.
