A control system manages, commands, directs, or regulates the behavior of other devices or systems using control loops. It can range from a single home heating controller using a thermostat

controlling a domestic boiler to large Industrial control systems which are used for controlling processes or machines. For continuously modulated control, a feedback controller is used to automatically control a process or operation. The control system compares the value or status of the process variable  $be_i$

Design is central to all engineering, but especially to control system design. Learn the process of analyzing and designing feedback control systems starting from a physical model of a system which will focus on everyday applications. Lectures are delivered by faculty who describe their real world experience with control system design and share their analysis from a variety of fields.
