Business Model Generation is a handbook for visionaries, game changers, and challengers striving to defy outmoded business models and design tomorrow's enterprises. If your organization needs to adapt to harsh new realities, but you don't yet have a strategy that will get you out in front of your competitors, you need Business Model Generation. Co-created by 470 "Business Model Canvas" practitioners from 45 countries, the book features a beautiful, highly visual, 4-color design that takes powerful strategic ideas and tools, and makes them easy to implement in your organization. It explains the most common Business Model patterns, based on concepts from leading business thinkers, and helps you reinterpret them for your own context. You will learn how to systematically understand, design, and implement a game-changing business model--or

analyze and renovate an old one. Along the way, you'll understand at a much deeper level your customers, distribution channels, partners, revenue streams, costs, and your core value proposition. Business Model Generation features practical innovation techniques used today by leading consultants and companies worldwide, including 3M, Ericsson, Capgemini, Deloitte, and others. Designed for doers, it is for those ready to abandon outmoded thinking and embrace new models of value creation: for executives, consultants, entrepreneurs, and leaders of all organizations. If you're ready to change the rules, you belong to "the business model generation!"

This book contains enough material for three complete courses of study. It provides an introduction to the world of logic, sets and relations. It explains the use of the Znotation in the specification of realistic systems. It shows how Z specifications may be refined to produce executable code; this is demonstrated in a selection of case studies. The essentials of specification, refinement and proof are covered, revealing techniques never previously published. In April 1991 BusinessWeek ran a cover story entitled, "Can't Work This Thing, about the difficulties many people have with consumer products, such as cell phones and VCRs. More than 15 years later, the situation is much the same -but at a very different level of scale. The disconnect between people and technology has had society-wide consequences in the large-scale system accidents from major human error, such as those at Three Mile Island and in Chernobyl. To prevent both the individually annoying and nationally significant consequences, human capabilities and needs must be considered early and throughout system design and development. One challenge

for such consideration has been providing the background and data needed for the seamless integration of humans into the design process from various perspectives: human factors engineering, manpower, personnel, training, safety and health, and, in the military, habitability and survivability. This collection of development activities has come to be called human-system integration (HSI). Human-System Integration in the System Development Process reviews in detail more than 20 categories of HSI methods to provide invaluable guidance and information for system designers and developers. Protecting buildings and their
occupants from biological and
chemical attacks to ensure
continuous building operations is
seen as an urgent need in the
Department of Defense, given
recent technological advances
and the changing threats.
Toward this end, the
Department of Defense
established the Immune Building
Program to develop protective
systems to deter biological and
chemical attacks on military
facilities and minimize the
impacts of attacks should they
occur. At the request of the
Defense Threat Reduction
Agency, the National Research
Council convened a committee
to provide guiding principles for
protecting buildings from
airborne biological or chemical
threat agents and outline the
variables and options to consider
in designing building protection
systems. This report addresses
such components of building
protection as building design and
planning strategies; heating,

ventilating, and air-conditioning
systems; filtration; threat
detection and identification
technologies; and operational
responses. It recommends that
building protection systems be
designed to accommodate
changing building conditions,
new technologies, and emerging
threats. Although the report's
focus is on protection of military
facilities, the guiding principles it
offers are applicable to protection
of public facilities as well.
