In the past, radiographs of the hand have been described as the "skeleton's calling card", showing manifestations of many different diseases. As hand and wrist imaging has become increasingly sophisticated, this observation has become more true than ever. This is a comprehensive, up-to-date textbook on imaging of the hand and wrist. In the first part of the book, the various imaging techniques are discussed in detail. Individual chapters are devoted to radiography, ultrasound, CT, MRI and nuclear medicine. The second part of the book gives an authoritative review of the various pathologies that may be encountered in the hand and wrist, encompassing congenital and developmental abnormalities, trauma, and the full range of localized and systemic disorders. Each chapter is written by an acknowledged expert in the field, and a wealth of illustrative material is included. This book will be of great value to musculoskeletal and general radiologists, orthopaedic surgeons and rheumatologists.

This book provides a systematic application of anatomical and dynamic principles to the practical understanding and diagnosis of intra-abdominal diseases. Anatomical sections and injection studies form a basis for understanding the characteristic features of many common and uncommon diseases and their spread and localization in the abdomen. These relationships and specific criteria provide a rational system for accurate radiological analysis in plain films, conventional contrast studies, ultrasonography, and computerized transaxial tomography (CTT). This information leads to the uncovering of clinically deceptive diseases, the evaluation of the effects of disease, the anticipation of complications, and the determination of the appropriate diagnostic and therapeutic approaches. The introductory atlas presents full color anatomical cross sections of the abdomen and pelvis, complemented by labeled tracings, and detailed CTT scans at corresponding levels. The sections, which are approximately 3.8 cm (1.5 in.) thick, were obtained from fresh cadavers frozen in dry ice for 48 hours,

in order to maintain the true intimate anatomical relationships. The accompanying text of the atlas stresses normal relationships, common variants, and the basis of their radiological identification, particularly in plain films. The subsequent chapters deal with the diagnosis and the pathways of spread of infection, malignancies, and traumatic and inflammatory effusions within the intra- and extraperitoneal spaces. Emphasis is placed on the specific localizing features based on the anatomical planes and recesses and the dynamics of extension of disease.

Since the publication of the Institute of Medicine (IOM) report *Clinical Practice Guidelines We Can Trust* in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical

health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.

The user can also 'custom-build' their own exams based on their own choice of subjects and number of questions, sit an exam that is automatically set by the program using all of the questions on the CD, or they can sit a 'shuffled' version of an exam, whereby the question parts (A-E) are reorganised automatically to avoid pattern recognition. The software also allows the user to set their own 'confidence level' when taking an exam and it will automatically mark, analyse and store completed exams for future review and re-sitting, allowing the package to be used as a fully interactive self-learning tool.
