## Diesel Engine Cooling System

Today almost all new marine engines use the closed cooling system design. These systems are pressurized, just like your car or truck. By increasing the pressure inside the closed part of the system, the boiling point of the coolant is enhanced.

Diesel Engine Cooling System Antifreeze Coolant Additive by Hy-per Lube is Specifically Formulated to Improve the Cooling Ability of Modern Turbocharged and Inter-cooled Diesel Engines. Our Product also acts as a Complete Supplemental Coolant Additive Providing Protection from Cavitation, Corrosion, and Electrolysis.

## Internal combustion engine cooling - Wikipedia

The engine cooling system filter and conditioner is a compact bypass type unit with a replaceable spin-on type element. The factory-installed coolant filter is mounted on the gear case cover.

Installing Coolant System Filters. The ideal amount of nitrite in a diesel cooling system is around 800 ppm (parts per million). If levels drop below this the protection of the cylinder liners is compromised. However, if the concentration of nitrite is greater than 800 ppm, other things are compromised.

In contrast, a liquid-cooled engine might dump heat from the engine to a liquid, heating the liquid to 135 °C (Water's standard boiling point of 100 °C can be exceeded as the cooling system is both pressurised, and uses a mixture with antifreeze) which is then cooled with 20 °C air.

being placed on the cooling system. The most important function of the EGR coolers put a greater thermal stress on the coolant and can cause breakdown of the glycol."

### **Diesel Engine Cooling System**

Most marine diesel engines rely on what's known as a closed cooling system. As with an automobile engine, the heat of combustion is absorbed by antifreeze (or, more accurately, coolant). In a car, that heat is then released airborne, via a radiator; with a sailboat, it's transferred to the ocean via a heat exchanger.

The engine coolant circulated back into the engine and the raw water expelled out of the boat through the exhaust. Another common type of closed cooling systems is known as a Keel Cooler. This is done by eliminating the heat exchanger.

There are many causes of diesel engine overheating including coolant, radiator and air inlet issues however this common problem can be easily prevented. Maintaining A Diesel Engine Cooling System. The purpose of the coolant (antifreeze or water) flowing through your diesel is to regulate the heat within the cylinder head and engine block that's created by the combustion process. In order to accomplish that job the coolant must be pumped around the engine compartment, pick up heat from the engine,...
