Note! The order of a differential equation is the order of the highest derivative appearing in the equation. Example 1.3: Equation 1.1 is a first-order differential equation; 1.2, 1.4, and 1.5 are second-order differential equations. (Note in 1.4 that the order of the highest derivative appearing in the equation is two.)

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x . The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x . Thus x is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...
