The vast reduction in size and power consumption of CMOS circuitry has led to a large research effort based around the vision of wireless sensor networks. The proposed networks will be comprised of thousands of small wireless nodes that operate in a multi-hop fashion, replacing long transmission distances with many low power, low cost wireless devices.

The result will be the creation of an intelligent environment responding to its inhabitants and ambient conditions.

Wireless devices currently being designed and built for use in such environments typically run on batteries. However, as the networks increase in number and the devices decrease in size, the replacement of depleted batteries will not be practical. The cost of replacing batteries in a few devices that make up a small network about once per year is modest. However, the cost of replacing thousands of devices in a single building annually, some of which are in areas difficult to access, is simply not practical. Another approach would be to use a battery that is large enough to last the entire lifetime of the wireless sensor device. However, a battery large enough to last the lifetime of the device would dominate the overall system size and cost, and thus is not very attractive. Alternative methods of powering the devices that will make up the

wireless networks are desperately needed. From respected performer and arranger

Wireless sensors and sensor networks (WSNs) are nowadays becoming increasingly important due to their decisive advantages. Different trends towards the Internet of Things (IoT), Industry 4.0 and 5G Networks address massive sensing and admit to have

wireless sensors delivering measurement data directly to the Web in a reliable and easy manner. These sensors can only be supported, if sufficient energy efficiency and flexible solutions are developed for energy-aware wireless sensor nodes. In the last years, different possibilities for energy harvesting have been investigated showing a high level of maturity. This book gives therefore an overview on fundamentals and techniques for energy harvesting and energy transfer from different points of view. Different techniques and methods for energy transfer, management and energy saving on

network level are reported together with selected interesting applications. The book is interesting for researchers, developers and students in the field of sensors, wireless sensors, WSNs, IoT and manifold application fields using related technologies. The book is organized in four major parts. The first part of the book introduces essential fundamentals and methods, while the second part focusses on vibration converters and hybridization. The third part is dedicated to wireless energy transfer, including both RF and inductive energy transfer. Finally, the fourth part of the book treats energy saving and management strategies. The main contents are:

- Essential fundamentals and methods of wireless sensors
- Energy harvesting from vibration
- Hybrid vibration energy converters
- Electromagnetic transducers
- Piezoelectric transducers
- Magneto-electric transducers
- Non-linear broadband converters
- Energy transfer via magnetic fields
- RF energy transfer
- Energy saving techniques
- Energy management strategies
- Energy management on network level
- Applications in agriculture
- Applications in structural health monitoring
- Application in power grids

When Lane's company flies her to a Black Falcon concert to gain Noel's attention, emotions run high the moment she

sees him and realizes she's far from over him. But Noel's countless trysts with groupies and his cocky attitude make Lane believe he isn't the same guy she once loved-now he seems to only want her body. Then after Lane discloses she needs him to procure a job, Noel proves he's a changed man by forcing her to go on the road with him in order to get it. After Lane reluctantly takes Noel up on his offer, she becomes willing to do whatever it takes to keep him satisfied, even if it means succumbing to his seductive ways.
