Higher education legislation is frequently changed by policy makers, who are acutely conscious that specific changes have repercussions through the law of general applicability, and eventually may alter and revise fundamental societal concepts. However, normative systems are complex, and the impact and direction of legal and social repercussions are neither always intended, now are they easily foreseen. It is the purpose of this book to identify the chosen directions, and to trace the concurrent developments, by way of comparative analysis. Maintaining or restoring the requisite equilibrium between consolidation and change today, is, virtually everywhere, premised by trends and measures taken well beyond the national dominion.

Cameroon has strong goals for its growth and development. By 2035, it aims to be an emerging economy. The country ’ s medium-term goals are focused on alleviating poverty, consolidating democracy, and achieving national unity—while respecting diversity. This report contributes substantively to the Government ’ s vision on Strategy for Growth and Employment, putting human development and employment at center stage. Cameroon faces three main challenges: • Developing more robust formal and informal employment opportunities by strengthening human development. • Increasing productivity in agriculture, mining, and key value chains (timber, tourism, and information and communication technology). • Advancing growth by investing in infrastructure and improving the business climate and regional integration. The Strategy sets a target for reducing underemployment from 76 percent of the workforce to 50 by 2020 by creating tens of thousands of formal jobs. But based on results from the first two years of its implementation, the strategy is far from achieving that target. This report is meant to support Cameroon ’ s efforts to build the skills of its workers. This report reaches conclusions and offers policy recommendations to answer six questions: • What has been the trajectory of Cameroon ’ s economic growth? Which sectors have contributed to growth? • What jobs are being created? • What types of skills are being used in the sectors where the highest percentages of the population are employed? • What are the demand and supply barriers to skills? • Which policies and institutions are in play? Are they sufficient? • What needs to or could be reformed? Cameroon has good prospects for moving to middle-income status. It can create a more dynamic, responsive workforce. But a new strategy is required. It can be done. This report proposes new directions and provides recommendations. Outcomes are expected. Work has never been easy. But many have been working—and Cameroon can work.

Awarded the Dexter Prize by the Society for the History of Technology A unique comparative history of the evolution of modern electric power systems, Networks of Power not only provides an accurate representation of large-scale technological change but also demonstrates that technology itself cannot be understood or directed unless placed in a cultural context. For Thomas Highes, both the invention of the simplest devices (like the lightbuld itself) and the execution of the grandest schemes (such as harnessing the water power of the Bavarian Alps) fit into an overarching model of technological devleopment. His narrative is an absorbing account of the creative genius, scientific achievements, engineering capabilities, managerial skills, and entrepreneurial risks behind one of the most commonplace amenities of the modern age.

Two groups of students in introductory physics courses of an Access Program for engineering technologies were the subjects of this study. Students with a wide range of academic histories and abilities were enrolled in the program; many of the students were re-entry and academically unprepared for post-secondary education. Five years of historical data were evaluated to use as a benchmark for revised instruction. Data were gathered to describe the pre-course academic state of the students and their academic progress during two physics courses. Additional information was used to search for factors that might constrain academic success and as feedback for the instructional methods. The data were interpreted to regulate constructivist design features for the physics courses. The Engineering Technology Access Program was introduced to meet the demand from non-traditional students for admission to two-year engineering technology programs, but who did not meet normal academic requirements. The duration of the Access Program was two terms for electronic and computer engineering students and three terms for civil and mechanical engineering students. The sequence of mathematics and physics courses was

different for the two groups. The Civil/Mechanical students enrolled in their first mathematics course before undertaking their first physics course. The first mathematics and physics courses for the Electronics students were concurrent. Academic success in the two groups was affected by this difference. Over a five-year period the success rate of students graduating with a technology diploma was approximately twenty-five percent. Results from this study indicate that it was possible to reduce the very high attrition in the combined Access/Technology Programs. While the success rate for the Electronics students increased to 38% the rate for the Civil/Mechanical students increased dramatically to 77%. It is likely that several factors, related to the extra term in the Access Prog.

In a time of changing technology and cultural shifts, it is difficult to measure some aspects of the workforce. Education and the American Workforce brings together a comprehensive collection of employment and education information from federal statistical agencies. The Census Bureau is the leading source of quality data about the nation's people and economy. The Bureau of Labor Statistics (BLS) is the principal federal agency responsible for measuring labor market activity, working conditions, and price changes in the economy. Together, these agencies produce a wealth of information about the American workforce. This book includes information about the jobs that people hold, the occupations that they pursue, the industries where they work, and the education levels that people have attained. In addition to tables, each section also includes relevant figures and highlights of notable data. Some examples of interesting data found inside Education and the American Workforce include: With no formal educational requirement and a median salary of \$22,680, 4.5 million people are employed as retail salespersons, the most of any single occupation. Cashiers and food preparation/serving workers account for another 3.5 million each. There are 2.9 million registered nurses, the most numerous of occupations that require a bachelor ’ s degree. The biggest numeric decline is expected for Postal Service mail carriers, dropping by about 78,000 in ten years. When combined with other Postal Service occupations—such as clerks, sorters, postmasters, and others—a decline of 140,000 jobs is expected for the Postal Service. Among the 75 largest counties, Bronx County, NY had the highest number of residents age 25 and over with less than a high school diploma at 29.4 percent while Montgomery County, PA had the lowest percentage at 6.2 percent. Meanwhile, New York County, NY and Fairfax County, VA had the highest percentage of residents with a bachelor ’ s degree or higher at 59.9 percent followed by Montgomery County, MD at 57.9 percent among the 75 largest counties. Nationally, between 2011 and 2015, 29.8 percent of the population had a bachelor ’ s degree or higher.
