Discrete time control systems. The standard number system used for processing digital signals is the binary number system. In this system the code group consists of n pulses each indicating either "on" (1) or "off" (0). In the case of quantizing, n "on-off" pulses can represent 2ⁿ amplitude levels or output states.

Figure 1: A discrete time control input with zero order hold applied to a continuous time system. $G_k(j) = (11)$ For stability, the eigenvalues of G must have magnitude < 1 . So if the continuous time plant is stable ($\text{eig}(A) < 0$) the discrete time plant will have eigenvalues with magnitude less than 1.
