Discrete-Time Control Systems 1995.

Discrete time control systems. The standard number system used for processing digital signals is the binary number system. In this system the code group consists of n pulses each indicating either "on" (1) or "off" (0). In the case of quantizing, n "on-off" pulses can represent 2^n amplitude levels or output states.

A comprehensive treatment of the analysis and design of discrete-time control systems which provides a gradual development of the theory by emphasizing basic concepts and avoiding highly mathematical arguments. The book features comprehensive treatment of pole placement, state observer design, and quadratic optimal control.

Figure 1: A discrete time control input with zero order hold applied to a continuous time system. $G_k(j) = 1/H_u(j)$:

(11) For stability, the eigenvalues of G must have magnitude < 1 . So if the continuous time plant is stable ($\sigma(A) < 0$) the discrete time plant will have eigenvalues with magnitude less than 1.
