The Human Dissector is a guidebook for today's student studying human anatomy. The Human Dissector presents the student with over 70 topics, each corresponding to one dissection session, giving immediate access to the essentials and helping the student to avoid any extraneous detail. Clinical points are emphasised alongside the details of dissection, stressing the practical application of anatomy to medicine. Extensively illustrated and carefully designed, the regional approach of The Human Dissector complements the systematic approach of Roger's Textbook of Anatomy, providing a complete guide to human anatomy. Alone, The Human Dissector is a user-friendly manual of dissection which helps to reinforce the student's understanding of anatomy.

*A Colour Atlas of the Rat* Thieme

This manual represents an experiment both as to choice of animal and plan of work. The dog has been chosen as subject of dissection instead of a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using the horse or ox owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected without removing it from the thorax. Terms used in veterinary anatomy are largely taken from human anatomy. Since in the dog structures closely resemble those of man, an advantage in making homologies to the mutual benefit of teacher and student results. In general all terms have been Anglicized except most names of muscles, and even these Latin names have been used as if they were English in some places. The Latin terms were retained to differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them. The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger and Baum, and Sisson and Grossman have been used frequently as references. It is probable that both have influenced the terminology more than they should, since a uniform terminology is desired by all anatomists.

The Human Brain in Dissection will significantly update the previous edition published in 1988. The last 20 years have seen a significant shift in the way that neuroanatomy is taught in both undergraduate and graduate neuroscience courses, as well as doctorate courses: not only has the time allocated for these courses been reduced, but the methodologies for teaching have become more focused and specific due to these time constraints. The Human Brain in Dissection, Third Edition will provide detailed features of the human brain with the above limitations in mind. 50 new plates will be added to the existing 123 in order to permit the student to see all salient structures and to visualize microscopic structures of the brain stem and spinal cord. Each chapter will cover a

specific area of the human brain in such a way that each chapter can be taught in one two-hour neuroanatomy course. New to this edition is the inclusion of a section in each chapter on clinically relevant examples. Each chapter will also include a specific laboratory exercise. And finally, the author has included a question and answer section that is relevant to the USMLE, as well as recommended readings, neither of which were included in the previous editions. This new edition of The Human Brain in Dissection will allow the student to: understand basic principles of cellular neuroscience; learn gross and microscopic anatomy of the central nervous system (Brain, brainstem, and spinal cord); relate the anatomy of central neural pathways to specific functional systems; be able to localize and name a CNS lesion when presented with neurological symptoms, and appreciate higher cortical functions and how they relate to the practice of neurology. neuroscience

Atlas and Dissection Guide for Comparative Anatomy Mosby Incorporated

This Color Atlas of Anatomy features full-color photographs of actual cadaver dissections, with accompanying schematic drawings and diagnostic images. The photographs depict anatomic structures with a realism unmatched by illustrations in traditional atlases and show students specimens as they will appear in the dissection lab. Chapters are organized by region in order of standard dissection, with structures presented both in a systemic manner, from deep to surface, and in a regional manner. This edition has additional clinical imaging, including MRIs, CTs, and endoscopic techniques. New graphics include clinically relevant nerve and vessel varieties and antagonistic muscle functions. Many older images have been replaced with new, high-resolution images. Black-and-white dissection photographs have been replaced with color photography. A companion website will include an Image Bank, interactive software (similar to an Interactive Atlas), and full text online.
