A distributed operating system is a

independent, networked,
communicating, and physically separate
computational nodes. They handle jobs
which are serviced by multiple CPUs.
Each individual node holds a specific

software subset of the global aggregate
operating system. Each subset is a
composite of two distinct service
provisioners. The first is a ubiquitous
minimal kernel, or microkernel, that
directly controls that node's hardware.
Second is a higher-level collect

Distributed computing - Wikipedia
A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal. Three significant characteristics of distributed systems are: concurrency of components, lack of a global clock, and independent failure of components.
