Multicomputer- the distributed Operating system uses a separate uniprocessor OS on each computer for communicating between different computers. In distributed OS, a common set of services is shared among multiple processors in such a way that they are meant to execute a distributed application effectively and also provide services to separate independent computers connected in a network as shown in fig below

Distributed computing - Wikipedia

Distributed Systems. Computer Science MCA Operating System. A distributed system contains multiple nodes that are physically separate but linked together using the network. All the nodes in this system communicate with each other and handle processes in

tandem. Each of these nodes contains a small part of the distributed operating system software.

A distributed system is a system whose components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a

common goal.

A distributed operating system is a software over a collection of independent, networked, communicating, and physically separate computational nodes. They handle jobs which are serviced by multiple CPUs. Each individual node holds a specific software subset of the global aggregate operating system.
