Thus, the old strand of DNA directs the synthesis of a new strand of DNA through complementary base pairing. The old strand then unites with the new strand to reform a double helix. This process is called semiconservative replication because one of the old strands is conserved in the new DNA double helix. Figure 10-1 DNA replication. The double helix opens and a complementary strand of DNA is synthesized along

DNA Replication One of the major misconceptions of DNA replication and cell division is the role of "interphase" in cell replication. Most people think that interphase is this inert "sleeping" phase, and all the exciting activity happens in mitosis. Yet again, it is those mitosis-centric jerks that keep

maligning "interphase."
