Study Guide Chapter 7: DNA Structure and Replication Biologically Unique: How DNA helped free an innocent man.
Driving Question 1: What is the structure of DNA, and how is DNA organized in cells? Why should you care? DNA is the hereditary molecule – passed from parents to offspring – that serves as

the instruction manual for “building” each individual.

Study Guide: DNA Synthesis and Repair — The Biology Primer
Thus, the old strand of DNA directs the synthesis of a new strand of DNA through complementary base pairing. The old strand then unites with the new strand to re-form a double helix. This process is called semiconservative

replication because one of the old strands is conserved in the new DNA double helix. Figure 10-1 DNA replication. The double helix opens and a complementary strand of DNA is synthesized along each strand.

DNA Replication One of the major misconceptions of DNA replication and cell division is the role of "interphase" in cell replication. Most people think that interphase is this inert "sleeping" phase, and all the exciting activity happens in mitosis. Yet again, it is those mitosis-centric jerks that keep maligning "interphase."

Study Guide for Test: DNA, Replication and Protein Synthesis

DNA replication happens the S phase of Interphase and is split into the binding of enzymes to existing DNA, unwinding of the double helix, and synthesis of new matching strand for each existing strand

Describe DNA replication. | Study.com

DNA replication is the copying of DNA so that replicating cells will have enough DNA for daughter cells, or the new cells derived from the original cell. Cell division, or the making of one cell into two new cells, occurs through mitosis for non-sex cells, or those cells not involved in...sex, and meiosis for sex cells, or those cells that do get down and dirty faster than Vinny and Pauly D on a good night at Karma.
