New technologies are revolutionising the way manufacturing and supply chain management are implemented. These changes are delivering manufacturing firms the competitive advantage of a highly flexible and responsive supply chain and manufacturing system to ensure that they meet the high expectations of their customers, who, in today's economy, demand absolutely the best service, price, delivery time and product quality. To make e-manufacturing and supply chain technologies effective, integration is needed between various, often disparate systems. To understand why this is such an issue, one needs to understand what the different systems or system components do, their objectives, their specific focus areas and how they interact with other systems. It is also required to understand how these systems evolved to their current state, as the concepts used during the early development of systems and technology tend to remain in place throughout the life-cycle of the systems/technology. This book explores various standards, concepts and techniques used over the years to model systems and hierarchies in order to understand where they fit into the organization and supply chain. It looks at the specific system components and the ways in which they can be designed and graphically depicted for easy understanding by both information technology (IT) and non-IT personnel. Without a good implementation philosophy, very few systems add any real benefit to an organization, and for this reason the ways in which systems are implemented and installation projects managed are also explored and recommendations are made as to possible methods that have proven successful in the past. The human factor and how that impacts on system success are also addressed, as is the motivation for system investment and subsequent benefit measurement processes. Finally, the vendor/user supply/demand within the e-manufacturing domain is explored and a method is put forward that enables the reduction of vendor bias during the vendor selection process. The objective of this book is to provide the reader with a good understanding regarding the four critical factors (business/physical processes, systems supporting

the processes, company personnel and company/personal performance measures) that influence the success of any e-manufacturing implementation, and the synchronization required between these factors. · Discover how to implement the flexible and responsive supply chain and manufacturing execution systems required for competitive and customer-focused manufacturing · Build a working knowledge of the latest plant automation, manufacturing execution systems (MES) and supply chain management (SCM) design techniques · Gain a fuller understanding of the four critical factors (business and physical processes, systems supporting the processes, company personnel, performance measurement) that influence the success of any e-manufacturing implementation, and how to evaluate and optimize all four factors

Concepts such as e-voting, e-democracy, e-participation, online campaigning, and e-parliament are the most powerful proof of the use of ICTs in political activities, processes, and institutions. E-Parliament and ICT-Based Legislation: Concept, Experiences and Lessons presents a conceptual framework regarding e-parliament and analyzes the impacts of ICTs on the structure of parliament, its functions, relations with other actors, and the legislative process. As a result of the means and opportunities created by ICTs, parliaments have had a chance to simplify and integrate their administrative processes and involve citizens in legislative processes. This book reflects on new understandings, developments, and practices in parliaments within the framework of ICT usage.

GroupWise allows corporate users to manage documents, share calendars, and control project workflow across network operating systems, including Novell NetWare, Windows NT, and Windows 2000. Changes in version 6.5 include improvements to the user interface and to integration tools for third-party developers. The software allows employees to access business information via

a Web browser on a desktop or a laptop PC, and from wireless handhelds like Research In Motion's BlackBerry devices.

Approximately 34 million people use GroupWise, with an average of one administrator per 1000 end-users. Novell's GroupWise 6.5 Administrator's Handbook is an in-depth, authoritative guide for administrators of GroupWise. It helps networking and messaging professionals plan and install a GroupWise system, set up multiple post office domain systems, configure messaging and Internet services, migrate from previous versions of GroupWise, and troubleshoot message flow and fix directory problems.

There are a myriad of books that have been published on knowledge management. However, very few of these books give the practical know-how of what truly is needed in the information professional/manager's mind: how to make the decision whether knowledge management is right for you; how to explain the pros and cons of the various knowledge management alternatives/solutions; how to determine which knowledge management solution, if any, is the best fit with your organizational culture; how to explain the way to show the expected value-added benefits of using knowledge management; and how to discuss lessons learned in applying knowledge management (i.e. how others have utilized KM techniques for enhanced decision making).

"Commercializing and exploiting applied Information and Communication Technologies (ICT) research results is critical in reducing the global Digital Divide and building a sustainable Knowledge Economy. A major challenge for leveraging ICT around the world is taking account of local and regional differences. This requires meaningful cross-border communication between researchers, government and industry, as well as strategic dialogues in relation to regulation and policy. While it is clear that the Digital Divide can be challenging in Europe and the Americas, clearly there are greater difficulties to be overcome in Asia and Africa. That acknowledged, it is often striking how once basic infrastructure and regulatory issues have been addressed and how learning from the experiences of others can enhance the impact of leveraging ICT. This book brings together a comprehensive collection of over 210 in ten broad thematic areas. These are: ICT for Networked Enterprise; e-Government and e-Democracy; eHealth, Collaborative Working Environments; Networked, Smart and Virtual Organizations; SME Issues; Technology Enhanced Learning and ICT Skills; Security and Identity Management; and Mobility and Digital Content. Papers within each thematic area are grouped as Issues, Applications and Case Studies, reflecting their primary focus."

The amounts of information that are flooding people both at the workplace and in private life have increased dramatically in the past ten years. The number of paper documents doubles every four years, and the amount of information stored on all data carriers every six years. New knowledge, however, increases at a considerably lower rate. Possibilities for automatic content recognition in various media and for the processing of documents are therefore becoming more important every day. Especially in economic terms, the efficient handling of information, i.e., finding the right information at the right time, is an invaluable resource for any enterprise, but it is particularly important for small- and medium-sized enterprises. The market for document management systems, which in Europe had a volume of approximately 5 billion euros in 2000, will increase considerably over the next few years. The BMBF recognized this development at an early stage. As early as in 1995, it pooled national capabilities in this field in order to support research on the automatic processing of information within the framework of a large collaborative project (READ) involving both industrial companies and research centres. Evaluation of the results led to the conclusion that research work had been successful, and, in a second phase, funding was provided for the collaborative follow-up project Adaptive READ from 1999 to 2003. The completion of these two important long-term research projects has contributed substantially to

improving the possibilities of content recognition and processing of handwritten, printed and electronic documents.
