The Swiss National Forest Inventory (NFI) is a forest survey on national level which started in 1982 and has already reached its 5th survey cycle (NFI5). It can be characterized as a multisource and multipurpose inventory where information is mainly collected from terrestrial field surveys using permanent sample plots. In addition, data from aerial photography, GIS and forest service questionnaires are also included. The NFI's main objective is to provide statistically reliable and sound figures to stakeholders such as politicians, researchers, ecologists, forest service, timber industry, national and international organizations as well as to international projects such as the Forest Resources Assessment of the United Nations. For Switzerland, NFI results are typically reported on national and regional level. State of the art methods are applied in all fields of data

collection which have been proven to be of international interest and have even served as a basis for other European NFIs. The presented methods are applicable to any sample based forest inventory around the globe. In 2001 the Swiss NFI published its methods for the first time. Since then, many methodological changes and improvements have been introduced. This book describes the complete set of methods and revisions since NFI2. It covers various topics ranging from inventory design and statistics to remote sensing, field survey methods and modelling. It also describes data quality concepts and the software framework used for data storage, statistical analysis and result presentation.

Working capital is commonly understood as the fund needed to meet the day-to-day expenses of an enterprise. A finance manager finds that the funds for meeting these expenses get blocked in current assets. He, therefore, looks for liquidity support in net working capital (NWC), which is equivalent to the excess of current assets over current liabilities. A banker also looks at the size of NWC as the long-term stake of the business in funding the current assets. But for a production manager, liquidity is synonymous to uninterrupted supply of material inputs to the production lines. Similarly, for a marketing manager, if there is no production, his marketing outlets dry up despite demand in the market. While the finance manager discourages overstocking of inventory, the production manager and the marketing manager dread of being out of stock. In this conflict the goal of the organisation often takes a back seat. This book

aims at resolving these conflicts by adopting a techno-financial approach to working capital management. In the previous edition a full chapter on Service Business: Risk Analysis and Working Capital Assessment was introduced to understand the nature of service business and the risks associated with it followed by developing a model for assessment of working capital requirement. Whereas, in the Fourth Edition, a new chapter on Technological Progress, Innovations and Startups—A New Financing Methodology has been introduced to fill a long-felt gap in financing of emerging industries. Besides, the book is revised and updated extensively by incorporating the current researches in the field; particular mention can be made of Cash pooling system, Bullwhip effect and newer approaches to inventory recording system. Throughout the book, every concept is presented with worked-out examples and case studies for easy comprehension of the subject. The book is primarily addressed to postgraduate students majoring in Finance and to those pursuing professional courses in

Accounts (CA) and Cost Accounting (ICWA). The book will also be very useful for practising finance executives, risk managers and also purchase/materials managers. TARGET AUDIENCE o MBA (Finance) o CA and ICWA Aspirants

Swiss National Forest Inventory – Methods and Models of the Fourth Assessment Springer Collections of digital documents can nowadays be found everywhere in institutions, universities or companies. Examples are Web sites or intranets. But searching them for information can still be painful. Searches often return either large numbers of matches or no suitable matches at all. Such document collections can vary a lot in size and how much structure they carry. What they have in common is that they typically do have

some structure and that they cover a limited range of topics. The second point is significantly different from the Web in general. The type of search system that we propose in this book can suggest ways of refining or relaxing the query to assist a user in the search process. In order to suggest sensible query modifications we would need to know what the documents are about. Explicit knowledge about the document collection encoded in some electronic form is what we need. However, typically such knowledge is not available. So we construct it automatically.

Lean manufacturing, *The Modern Theory of the Toyota Production System: A Systems Inquiry of the World's Most Emulated and Profitable Management System* explains that your organization already has what it takes to succeed with TPS and what's probably missing is balance. Bridging the gap between implementation and theory, this text is the first of its kind to use systems theory to study how the pieces of the Toyota Production System (TPS) work together to achieve this much needed balance. Lean practitioners will learn how to use system theory to improve overall decision making when applying Lean or Toyota-like management systems. Explaining that the glue that holds the pieces of TPS together is just as important as the pieces themselves, the book provides you with

invaluable guidance in the implementation of Lean manufacturing from a management perspective. It outlines a blueprint to help you develop a clear understanding of how the pieces of TPS need to come together so you can achieve something greater than what's possible with the individual pieces.
