The Viper stunned Americans by showing that Dodge, whose cars were all front-wheel drive (and mostly powered by four-cylinder engines), could make a raw, brutal, V10-powered car that could run with the best. Team Viper went a step further at Le Mans, proving that an American car could handle turns, too; so well that it won its class, repeatedly, at a fraction of the cost of the cars it beat. This book covers the transition from a concept to a rough and brutal rocket to a world-class supercar, and includes every generation. The story also tells of the rough times when the entire Viper business could have been sold to the highest bidder, and considers alternative paths the 2013-17 Viper might have taken. This is not just a gushing tribute to the Dodge Viper, the author provides an objective view of the full story, using business, historical, and enthusiast perspectives. The book looks at the business case for each generation, the development stories and their outcomes, and describes some of the issues owners may have to watch out for, particularly in the early models.

The truck's role in American society changed dramatically from the 1960s through the 1980s, with the rise of off-roaders, the van craze of the 1970s and minivan revolution of the 1980s, the popularization of the SUV as family car and the diversification of the pickup truck into multiple forms and sizes. This comprehensive reference book follows the form of the author's popular volumes on American cars. For each year, it provides an industry overview and, for each manufacturer, an update on new models and other news, followed by a wealth of data: available powertrains, popular options, paint colors and more. Finally, each truck is detailed fully with specifications and measurements, prices, production figures, standard equipment and more.

Dr. Victor Mark Silverstein is a Jewish African-American whose background is as unusual as his personality. He lives a privileged life as the Naval Research Laboratory's preeminent meteorologist and scientist. But beneath the facade of a self-centered, arrogant personality lies a seething, vulnerable man whose secrets have plagued his sleep since 1982. That's when he discovered the truth about what happened to his girlfriend, Sylvia. In the year 2007, his nightmares become a reality when weather satellites detect an environmental aberration. Memories from college at Penn State—and their accompanying heartbreak—push their way back into Silverstein's life. Only he knows the root cause of the phenomenon and its scientific basis—and the mastermind behind it all. This fast-paced thriller spans the globe: from the Suez Canal and Christmas Island to Istanbul, Turkey; to Monterey, California and Washington, DC; and finally to Bermuda. Silverstein and his feisty female assistant, Dr. Linda Kipling, begin a desperate and harrowing pursuit for the truth and for those responsible. With time running out and the environmental catastrophe unfolding, they must survive a terrifying ride through the eyewall of a hurricane. The final showdown pits good against evil and intellect against loyalty. Along the way, Silverstein finds peace and becomes reacquainted with a faith he abandoned long ago.

The NOx Storage-Reduction (NSR, also known as lean-NOx trap - LNT), is based upon the concept of storing NOx as nitrates over storage components, typically barium species, during a lean-burn operation cycle and then reducing the stored nitrates to N₂ during fuel-rich conditions over a precious metal catalyst [1]. NOx Selective Catalytic Reduction (SCR), on the other hand, is accomplished by deliberately introducing reductant urea into the engine exhaust to reduce NOx with the aid of a Cu(Fe)/zeolite catalyst [2]. These two technologies have been recognized as the most promising approaches for meeting stringent NOx emission standards for diesel vehicles within the Environmental Protection Agency's (EPA's) 2007/2010 mandated limits. For NSR, problems arising from either or both thermal and SO₂ deactivation must be addressed to meet durability standards. For SCR, SO₂ deactivation is less of an issue, but hydrothermal deactivation of the zeolite catalysts must be addressed. With continuing R & D efforts in advanced powertrains, highly novel operating modes for internal combustion engines (ICEs) are being researched in order to meet the very stringent new demands for fuel efficiency (e.g., U.S. "CAFE" standards for average miles/gallon are scheduled to increase dramatically over the next 10-15 years). These new ICE engine operation modes, while highly fuel-efficient, result in much lower exhaust temperatures than current engines; temperatures so low that it is hard to imagine how the current catalytic emission control technologies will be able to function. For example, while steady-state operation of the NOx reduction technology at 150 °C may be required, current "light-off" temperatures for CHA-based zeolite catalysts are closer to 200 °C. Therefore, understanding low-temperature limitations in NOx reduction has become one of the most daunting challenges in R & D on new catalyst materials and processes that can effectively eliminate emissions at these quite low exhaust temperatures. This project has two clear focuses: (1) development of potassium-based high-temperature NSR materials, and studying their key causes of deactivation and methods of regeneration. By comparing results obtained on 'Simple Model' Pt-K/Al₂O₃ with 'Enhanced Model' Pt-K/ MgAlOx and Pt-K/TiO₂ materials, we have developed an understanding of the role of various additives on the deactivation and regeneration processes. Studies have also been performed on the real commercial samples being used in a Dodge Ram truck with a Cummins diesel emission control system. However, the results about these 'commercial samples' will not be covered in this report. Following a brief description of our experimental approach, we will present a few highlights from some of the work performed in this CRADA with more details about these results provided in publications/reports/presentations lists presented at the end of the report. (2) for the Cu and Fe/Chabazite SCR catalysts, since these are so newly developed and references from open literature and industry are nearly absent, our work started from zeolite synthesis and catalyst synthesis methodology development, before research on their low- and high-temperature performance, deactivation, regeneration, etc. was conducted. Again, most work reported here is based on our "model" catalysts synthesized in-house. Work done on the 'commercial samples' will not be covered in this report.
