Although the field of disability services and societal understanding of disability issues have advanced in recent decades there remain controversial subjects and unresolved disputes. These cover a wide spectrum from legislation impacting the entire disability community such as the ADA, to culture clashes within a minority group such as the deaf community. Experts analyze and discuss nine of these controversies of particular interest to professional social workers. They are ones about which there are obvious disagreements and no readily available solutions . All sides of the issues are examined to enable readers to draw their own conclusions. The overall intent is to draw attention to each controversy and to motivate professional social workers to engage in personal as well as public dialogue about them. This book was originally published as a special issue of Journal of Social Work in Disability and Rehabilitation.

The purpose of the “Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC 7)” is to provide an evidence-based approach to the prevention and management of hypertension. The key messages of this report are: in those older than age 50, systolic blood pressure (SBP) of greater than 140 mmHg is a more important cardiovascular disease (CVD) risk factor than diastolic BP (DBP); beginning at 115/75 mmHg, CVD risk doubles for each increment of 20/10 mmHg; those who are normotensive at 55 years of age will have a 90 percent lifetime risk of developing hypertension; prehypertensive individuals (SBP 120–139 mmHg or DBP 80–89 mmHg) require health promoting lifestyle modifications to prevent the progressive rise in blood pressure and CVD; for uncomplicated hypertension, thiazide diuretic should be used in drug treatment for most, either alone or combined with drugs from other

classes; this report delineates specific high-risk conditions, which are compelling indications for the use of other antihypertensive drug classes (angiotensin-converting enzyme inhibitors, angiotensin-receptor blockers, beta blockers, calcium channel blockers); two or more antihypertensive medications will be required to achieve goal BP (less than 140/90 mmHg, or less than 130/80 mmHg for patients with diabetes and chronic kidney disease); for patients whose BP is greater than 20 mmHg above the SBP goal or 10 mmHg above the DBP goal, initiation of therapy using two agents, one of which usually will be a thiazide diuretic, should be considered; regardless of therapy or care, hypertension will only be controlled if patients are motivated to stay on their treatment plan. Positive experiences, trust in the clinician, and empathy improve patient motivation and satisfaction. This report serves as a guide, and the committee continues to recognize that the responsible physician's judgment remains

paramount.

Highly successful in its first two editions, McWhinney's Textbook of Family Medicine is one of the seminal texts in the field. While many family medicine texts simply cover the disorders a practitioner might see in clinical practice (thus they become watered-down internal medicine texts), McWhinney defines the principles and practices of family medicine as a separate and distinct field of practice. His initial sections cover the basis principles and philosophies of family medicine and a later section discusses the approach to the patients with common diseases encountered in practice (these discussions not only address these clinical problems, but each is a workshop for incorporating what it means to be a family physician into everyday practice). The new edition is updated throughout with help from a group of reviewers and a new coauthor, Tom Freeman, who is Chairman of the Department of Family Medicine at McWhinney's

institution, the University of Western Ontario.

“ This is an outstanding book, written by an outstanding and courageous physician who is a physician in the best sense of the word - who cares not only for the body but also for the deeper mind and soul. Dr. Coleman ’ s stories of clinical care are perfect examples of the highest ideals of medicine, and should be read not only by those who wish to understand the deeper roots of their symptoms but also by those who want to better care for their patients. With both clarity and an ear for storytelling, Dr. Coleman illustrates how presenting symptoms are both a mask and a set of clues to the real stressors and urges to growth that lie beneath the surface, and with consummate skill she traces these clues to their source in order to treat causes rather than symptoms. ”

Hypertension is one of the leading causes of death in the United States, affecting nearly one in three Americans. It is prevalent in adults and endemic in the older adult population. Hypertension is a major contributor to cardiovascular morbidity and disability. Although there is a simple test to diagnose hypertension and relatively inexpensive drugs to treat it, the disease is often undiagnosed and uncontrolled. A Population-Based Policy and Systems Change Approach to the Prevention and Control Hypertension identifies a small set of high-priority areas in which public health officials can focus their efforts to accelerate progress in hypertension reduction and control. It offers several recommendations that embody a population-based approach grounded in the principles of measurement, system change, and accountability. The

recommendations are designed to shift current hypertension reduction strategies from an individual-based approach to a population-based approach. They are also designed to improve the quality of care provided to individuals with hypertension and to strengthen the Center for Disease Control and Prevention's leadership in seeking a reduction in the sodium intake in the American diet to meet dietary guidelines. The book is an important resource for federal public health officials and organizations, especially the Center for Disease Control and Prevention, as well as medical professionals and community health workers.

Hypertension remains a leading cause of disability and death worldwide. Self-monitoring of blood pressure by patients at home is currently recommended as a valuable tool for the diagnosis and management of hypertension.

Unfortunately, in clinical practice, home blood pressure monitoring is often inadequately implemented, mostly due to the use of inaccurate devices and inappropriate methodologies. Thus, the

potential of the method to improve the management of hypertension and cardiovascular disease prevention has not yet been exhausted. This volume presents the available evidence on home blood pressure monitoring, discusses its strengths and limitations, and presents strategies for its optimal implementation in clinical practice. Written by distinguished international experts, it offers a complete source of information and guide for practitioners and researchers dealing with the management of hypertension.
