A thinking student is an engaged student Teachers
often find it difficult to implement lessons that help
students go beyond rote memorization and
repetitive calculations. In fact, institutional norms
and habits that permeate all classrooms can
actually be enabling "non-thinking" student
behavior. Sparked by observing teachers struggle to
implement rich mathematics tasks to engage
students in deep thinking, Peter Liljedahl has
translated his 15 years of research into this practical
guide on how to move toward a thinking classroom.
Building Thinking Classrooms in Mathematics,
Grades K – 12 helps teachers implement 14
optimal practices for thinking that create an ideal
setting for deep mathematics learning to occur.
This guide Provides the what, why, and how of
each practice and answers teachers ' most
frequently asked questions Includes firsthand
accounts of how these practices foster thinking
through teacher and student interviews and student
work samples Offers a plethora of macro moves,
micro moves, and rich tasks to get started
Organizes the 14 practices into four toolkits that
can be implemented in order and built on
throughout the year When combined, these unique
research-based practices create the optimal
conditions for learner-centered, student-owned
deep mathematical thinking and learning, and have
the power to transform mathematics classrooms like
never before.

Study and Master Mathematics Grade 6 CAPS
Learner's Book Effortless Math Education
www.EffortlessMath.com

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.
