Grids. Very often when drawing diagrams we will want to draw a grid. To do this we use the \draw command followed by by some additional arguments. For example, we specify the grid step size using step= and a length. We've also specified the colour gray and told it to make the lines very thin. After these arguments we enter the co-ordinates of the bottom-left corner, followed by the keyword grid ...

The graphics pipeline. By learning OpenGL, you've decided that you want to do all of the hard work yourself. That inevitably means that you'll be thrown in the deep, but once you understand the essentials, you'll see that doing things the hard way doesn't have to be so difficult after all. As you can see, the device-context (DC) object is a very powerful mechanism. Having said that, we can also use this layer of abstraction to draw onto a Windows Form. This paper will therefore begin with an example of a basic Windows Forms development in order to demonstrate how to draw graphics onto a Windows Form, or a control on that form.

Vector grid creation has been incorporated in QGIS for a long time: Vector -> Research Tools -> Vector Grid Note that the default grid spacing of 0.0001000000 units of the layer CRS is too small in most cases.. You might want to use Vector -> Geometry Tools -> Densify Geometries afterwards if you need to reproject the grid to another CRS where the lines should appear bended.
