A rotorcraft is a class of aircraft that uses large-diameter rotating wings to accomplish efficient vertical take-off and landing. The class encompasses helicopters of numerous configurations (single main rotor and tail rotor, tandem rotors, coaxial rotors), tilting proprotor aircraft, compound helicopters, and many other innovative configuration concepts. Aeromechanics covers much of what the rotorcraft engineer needs: performance, loads, vibration, stability, flight dynamics, and noise. These topics include many of the key performance attributes and the often-encountered problems in rotorcraft designs. This

comprehensive book presents, in depth, what engineers need to know about modelling rotorcraft aeromechanics. The focus is on analysis, and calculated results are presented to illustrate analysis characteristics and rotor behaviour. The first third of the book is an introduction to rotorcraft aerodynamics, blade motion, and performance. The remainder of the book covers advanced topics in rotary wing aerodynamics and dynamics.

Pharmakon: Plato, Drug Culture, and Identity in Ancient Athens examines the emerging concern for controlling states of psychological ecstasy in the history of western thought, focusing on ancient Greece (c. 750-146 BCE), particularly the Classical Period (c. 500-336 BCE) and especially the dialogues of the Athenian philosopher Plato (427-347 BCE).

Employing a diverse array of materials ranging from literature, philosophy, medicine, botany, pharmacology, religion, magic, and law, Pharmakon fundamentally reframes the conceptual context of how we read and interpret Plato's dialogues. Michael A. Rinella demonstrates how the power and truth claims of philosophy, repeatedly likened to a pharmakon, opposes itself to the cultural authority of a host of other occupations in ancient Greek society who derived their powers from, or likened their authority to, some pharmakon. These included Dionysian and Eleusinian religion, physicians and other healers, magicians and other magic workers, poets, sophists, rhetoricians, as well as others. Accessible to the general reader, yet challenging to the specialist, Pharmakon is a comprehensive examination of the place of drugs in ancient thought that will compel the reader to understand Plato in a new way.

Business process management is the basis for all

initiatives like SCM, CRM, ERP, or business intelligence. New component and internet-based software architectures and web services require a solid process management to deliver the expected business success. However, many organizations still struggle to find the right approach to business process management. IDS Scheer delivers with ARIS the framework to meet this challenge successfully. IDS Scheer has successfully applied its ARIS business process management approach at thousands of organizations worldwide such as Intel, Siemens, or the US Navy. This book presents international case studies in various manufacturing and service industries as well as the public sector. It shows how to achieve business process excellence in practice.

The implementation of the circular economy will entail a major transformation from a resource-destroying, linear economy to a circular one that operates within the planet's regenerative boundaries. This book presents an interim assessment of the implementation of a circular economy in the EU. It reveals what achievements have been made in various EU institutions, but which are scarcely perceived by the public; which basic scientific principles can be applied in this context; and what NGOs are demanding beyond this progress. It provides convincing arguments for abandoning the "hamster wheel" of material-based satisfaction of our needs, and shows that the primacy of the economy stands in the way of a good life for all. Given its focus, it will appeal to everyone interested in an ecologically sustainable economic system.

Essential Mathematics for Economics and Business has become

established as one of the leading introductory books on mathematics. It combines a non-rigorous approach to mathematics with applications in economics and business. The fundamental mathematical concepts are explained as simply and as briefly as possible, using a wide selection of worked examples, graphs and real-world applications.

- Mathematical preliminaries
- The straight line and applications
- Simultaneous equations
- Non-linear functions and applications
- Financial Mathematics
- Introduction to differentiation and applications
- Functions of several variables
- Integration and applications
- Linear algebra and applications
- Difference equations
- Solutions to progress exercises

A revealing and surprising look at how classification systems can shape both worldviews and social interactions. What do a seventeenth-century mortality table (whose causes of death include "fainted in a bath," "frighted," and "itch"); the identification of South Africans during apartheid as European, Asian, colored, or black; and the separation of machine- from hand-washables have in common? All are

examples of classification—the scaffolding of information infrastructures. In *Sorting Things Out*, Geoffrey C. Bowker and Susan Leigh Star explore the role of categories and standards in shaping the modern world. In a clear and lively style, they investigate a variety of classification systems, including the International Classification of Diseases, the Nursing Interventions Classification, race classification under apartheid in South Africa, and the classification of viruses and of tuberculosis. The authors emphasize the role of invisibility in the process by which classification orders human interaction. They examine how categories are made and kept invisible, and how people can change this invisibility when necessary. They also explore systems of classification as part of the built information environment. Much as an urban historian would review highway permits and zoning decisions to tell a city's story, the authors review archives of classification design to understand how decisions have been made. *Sorting Things Out* has a moral agenda, for each standard and category valorizes some point of view and silences another. Standards and classifications produce advantage or suffering. Jobs are made and lost; some regions benefit at the expense of others. How these choices are made and how we think about that process are at the moral and political core of this work. The book is an important empirical source for understanding the building of information infrastructures.

China Made MIT Press

"“Chinese people should consume Chinese products!” This slogan was the catchphrase of a movement in early twentieth-century China that sought to link consumption and nationalism by instilling a concept of China as a modern “nation” with its own “national products.” From fashions in clothing to food additives, from museums to department stores, from product fairs to advertising, this movement influenced all aspects of China’s burgeoning consumer culture. Anti-imperialist

boycotts, commemorations of national humiliations, exhibitions of Chinese products, the vilification of treasonous consumers, and the promotion of Chinese captains of industry helped enforce nationalistic consumption and spread the message—patriotic Chinese bought goods made of Chinese materials by Chinese workers in factories owned and run by Chinese. In *China Made*, Karl Gerth argues that two key forces shaping the modern world—nationalism and consumerism—developed in tandem in China. Early in the twentieth century, nationalism branded every commodity as either “Chinese” or “foreign,” and consumer culture became the place where the notion of nationality was articulated, institutionalized, and practiced. Based on Chinese, Japanese, and English-language archives, magazines, newspapers, and books, this first exploration of the historical ties between nationalism and consumerism reinterprets fundamental aspects of modern Chinese history and suggests ways of discerning such ties in all modern nations."

Business Process Excellence Cambridge University Press

This book highlights recent findings in industrial, manufacturing and mechanical engineering, and provides an overview of the state of the art in these fields, mainly in Russia and Eastern Europe. A broad range of topics and issues in modern engineering are discussed, including the dynamics of machines and working processes, friction, wear and lubrication in machines, surface transport and technological machines, manufacturing engineering of industrial facilities, materials engineering, metallurgy, control systems and their industrial applications, industrial mechatronics, automation and robotics. The book gathers selected papers presented at the 5th International Conference on Industrial Engineering (ICIE), held in Sochi, Russia in March 2019. The authors are experts in various fields of engineering, and all papers have been carefully reviewed. Given its scope, the book will be of interest to a wide readership, including mechanical and production engineers, lecturers in engineering disciplines, and engineering graduates.

This textbook is appropriate for senior undergraduate and first

year graduate students in mechanical and automotive engineering. The contents in this book are presented at a theoretical-practical level. It explains vehicle dynamics concepts in detail, concentrating on their practical use. Related theorems and formal proofs are provided, as are real-life applications. Students, researchers and practicing engineers alike will appreciate the user-friendly presentation of a wealth of topics, most notably steering, handling, ride, and related components. This book also: Illustrates all key concepts with examples Includes exercises for each chapter Covers front, rear, and four wheel steering systems, as well as the advantages and disadvantages of different steering schemes Includes an emphasis on design throughout the text, which provides a practical, hands-on approach

Mathematical modeling and computer simulation are useful tools for improving materials processing. While courses in materials processing have covered modeling, they have been devoted to one particular class of materials--polymers, metals, or ceramics. This text offers a new approach, presenting an integrated treatment of metallic and non-metallic materials. The authors show that a common base of knowledge--specifically, the fundamentals of heat transfer and fluid mechanics--unifies these seemingly disparate areas. They emphasize understanding basic physical phenomena and knowing how to include them in a model. The book also includes selected numerical methods, a wealth of practical, realistic examples, and homework exercises.
