Delta 20 is an old control. If it gets to the point where you aren't able to keep the servo drives in tune go into the parameters and reset the rapid rate down to maybe 150 ipm. atgordon liked this post 12-16-2015, 10:21 AM #3

A faulty power supply  
accounts for a significant  
portion of issues seen on older  
DynaPath controls, particularly  
Delta 10/20/30/40/50/60  
controls. Spontaneous control  
re-boots and watchdog (WD)  
timeouts are usually traced to  
issues with the power supply.  
Dynapath Delta 20 Cnc Control

All System/Delta 10/20 controls  
had 4-digit firmware levels  
preceded by the letter 'P' and  
possibly a revision letter (i.e.  
PA5523). Beginning with Delta  
30 controls, a different identifying  
system was used that is labeled as  
the 'CNC Exec ID' and utilizes  
numbers and letters in the  
following format: yy#.z##.##. The  
'#' denotes digits.

Delta 20 and Delta 30 controls  
do have buffered input (drip  
feed). Delta 40/50/60 and Delta  
1000/2000 controls have a  
"Systems Settings" screen that  
is accessible by pressing the  
soft key labeled as such on the  
"Fault/Status" page. An entry  
on this page labeled "Buffered  
Input" will indicate if this  
option is available.

### *DynaPath*

Dynapath still sells the  
manuals so selling a copy  
would be stepping on their  
toes (copyright). And yes,  
they do pay attention. I know  
the Delta 10/20 manual sells  
for about \$210.00; pricey but  
well worth it if you are new  
to this control.

2. How do I know which wiring diagram to use? In general, the proper wiring schematic is dependent on the CNC control installed. Each control series will have an MCP wiring diagram associated with it. The control system could be a Delta 10/20, a Delta 40/50/60 or a Delta 1000/2000, depending on the ship date.
