The author of The Time Traveler's Guide to Medieval England takes you through the world of Shakespeare and Queen Elizabeth I From the author of The Time Traveler's Guide to Medieval England, this popular history explores daily life in Queen Elizabeth's England, taking us inside the homes and minds of ordinary citizens as well as luminaries of the period, including Shakespeare, Christopher Marlowe, Sir Walter Raleigh, and Sir Francis Drake. Organized as a travel guide for the time-hopping tourist, Mortimer relates in delightful (and occasionally disturbing) detail everything from the sounds and smells of sixteenth-century England to the complex and contradictory Elizabethan attitudes toward violence, class, sex, and religion. Original enough to interest those with previous knowledge of Elizabethan England and accessible enough to entertain those without, The Time Traveler's Guide is a book for Elizabethan enthusiasts and history buffs alike.

This handbook is the first to address the practical aspects of this novel method. It provides a complete overview of the field and progresses from general considerations to real life scenarios in drug discovery research. Starting with an introductory historical overview, the authors move on to discuss ligand-based approaches, including 3D pharmacophores and 4D QSAR, as well as the concept and application of pseudoreceptors. The next section on structure-based approaches includes pharmacophores from ligand-protein complexes, FLIP and 3D protein-ligand binding interactions. The whole is rounded off with a complete section devoted to applications and examples, including modeling of ADME properties. With its critical evaluation of pharmacophore-based strategies, this book represents a valuable aid for project leaders and decision-makers in the pharmaceutical industry, as well as pharmacologists, and medicinal and chemists.

Over the years a number of excellent books have classified and detailed drug drug interactions into their respective categories, e.g. interactions at plasma protein binding sites; those altering intestinal absorption or bioavailability; those involving hepatic metabolising enzymes; those involving competition or antagonism for receptor sites, and drug interactions modifying excretory mechanisms. Such books have presented extensive tables of interactions and their management. Although of considerable value to clinicians, such publications have not, however, been so expressive about the individual mechanisms that underlie these interactions. It is within this sphere of "mechanisms" that this present volume specialises. It deals with mechanisms of in vitro and in vivo, drug-drug, drug food and drug-herbals interactions and those that cause drugs to interfere with diagnostic laboratory tests. We believe that an explanation of the mechanisms of such interactions will enable practitioners to understand more fully the nature of the interactions and thus enable them to manage better their clinical outcome. If mechanisms of interactions are better understood, then it may be possible for the researcher to develop meaningful animal/biochemical/tissue culture or physicochemical models to which new molecules could be exposed during their development stages. The present position, which largely relies on patients experiencing adverse interactions before they can be established or documented, can hardly be regarded as satisfactory. This present volume is classified into two major parts; firstly, pharmacokinetic drug interactions and, secondly, pharmacodynamic drug interactions.

Vivid, enjoyable and comprehensible, the poet and pre-eminent translator Stephen Mitchell makes the oldest epic poem in the world accessible for the first time. Gilgamesh is a born leader, but in an attempt to control his growing arrogance, the Gods create Enkidu, a wild man, his equal in strength and courage. Enkidu is trapped by a temple prostitute, civilised through sexual

experience and brought to Gilgamesh. They become best friends and battle evil together. After Enkidu's death the distraught Gilgamesh sets out on a journey to find Utnapishtim, the survivor of the Great Flood, made immortal by the Gods to ask him the secret of life and death. Gilgamesh is the first and remains one of the most important works of world literature. Written in ancient Mesopotamia in the second millennium B.C., it predates the Iliad by roughly 1,000 years. Gilgamesh is extraordinarily modern in its emotional power but also provides an insight into the values of an ancient culture and civilisation.

To a certain extent the dementias have been forgotten diseases until just recently when they were brought to the attention of the general public and health authorities as a result of the increasing number of cases in the aging population, especially among famous people, and because of the efforts of private foundations. The goals of the present volume are to present the dementias to health practitioners, to provide some basic information on their epidemiology and biological basis and to discuss the diagnostic and clinical problems that physicians and institutions face when caring for demented patients. This book explores the various types of dementias and is not limited to Alzheimer's disease although, as expected, more information is available and presented on this pathology. On the other hand, a few fundamental questions on dementia can only be answered through a comparison of the various forms. Examples of such questions are the following: Is the loss of cerebral tissue sufficient to cause dementia? Are there thresholds or is there a continuous progression toward the irreversible development of dementia? Are there common pathways in the dementing process? Are there common risk factors? Comparative analysis allows the common and distinctive patterns of the various dementias to be defined, ultimately leading to more focused therapeutic interventions.

This valuable reference delineates the ground water quality concerns associated with the planning and usage of septic tank systems. Septic tank systems represent a significant source of ground water pollution in the United States. Since many existing systems are exceeding their design life by several-fold, the usage of synthetic organic chemicals in the household and for system cleaning is increasing, and larger-scale systems are being designed and used.

Medicinal chemistry is both science and art. The science of medicinal chemistry offers mankind one of its best hopes for improving the quality of life. The art of medicinal chemistry continues to challenge its practitioners with the need for both intuition and experience to discover new drugs. Hence sharing the experience of drug research is uniquely beneficial to the field of medicinal chemistry. Drug research requires interdisciplinary team-work at the interface between chemistry, biology and medicine. Therefore, the topic-related series *Topics in Medicinal Chemistry* covers all relevant aspects of drug research, e.g. pathobiochemistry of diseases, identification and validation of (emerging) drug targets, structural biology, drugability of targets, drug design approaches, chemogenomics, synthetic chemistry including combinatorial methods, bioorganic chemistry, natural compounds, high-throughput screening, pharmacological in vitro and in vivo investigations, drug-receptor interactions on the molecular level, structure-activity relationships, drug absorption, distribution, metabolism, elimination, toxicology and pharmacogenomics. In general, special volumes are edited by well known guest editors.
