Asteroid Apophis is gaining
speed as it travels on its path
towards Earth. The object is
releasing radiation, which acts
like a tiny thruster - and
experts warn it could make
impact 48 years from now.

*Name Date Earth
Science Lab: Sun's Path
and Seasons*

As Earth orbits the Sun,
the tilt causes the direct
rays of the Sun to strike
locations between the
Tropic of Cancer (23.5
deg N) and the Tropic of
Capricorn (23.5 deg S).
New York is generally
located between 41 ? deg
N and 45 deg N latitude,

so it never receives the direct rays of the Sun. In other words, the Sun will never be found directly overhead (zenith) at solar noon during any point of the year for a location in NYS.

During this lab activity, students will study the seasonal apparent path of the Sun above the Arctic Circle. Topics

covered in this unit are coordinate location, insolation, celestial motions of Earth and the Sun, Seasons.

Earth Science Suns Path Lab Answers

The sun's path is an apparent path across the sky. Each day, the sun appears to move in an arc across the sky at a rate of 15° /hour, the rate that the Earth rotates on its axis. The sun is at its highest point at Solar Noon. In this lab, you will use a plastic hemisphere to represent the dome of the sky.
