Review of NASA's Solid-Earth Science Strategy
National Academies Press
We live on a dynamic Earth shaped by both natural processes and the impacts of humans on their environment. It is in our collective interest to observe and understand our planet, and to predict future behavior to the extent possible, in order to effectively manage resources, successfully respond to threats from natural and human-induced environmental change, and capitalize on the opportunities " social, economic, security, and more " that such knowledge can bring. By continuously monitoring and

exploring Earth, developing a deep understanding of its evolving behavior, and characterizing the processes that shape and reshape the environment in which we live, we not only advance knowledge and basic discovery about our planet, but we further develop the foundation upon which benefits to society are built. Thriving on Our Changing Planet presents prioritized science, applications, and observations, along with related strategic and programmatic guidance, to support the U.S. civil space Earth observation program over the coming decade.

Principles of Geology

Oxford University Press

The climate of the Earth is always changing. As the debate over the implications of changes in the Earth's climate has grown, the term climate change has come to refer primarily to changes we've seen over recent years and those which are predicted to be coming, mainly as a result of human behavior. This book serves as a broad, accessible guide to the science behind this often political and heated debate by providing scientific detail and evidence in language that is clear to both the non-specialist and the serious student. * provides all the scientific evidence for and possible causes of

climate change in one book * written by expert scientists working in the field * logical, non-emotional conclusions * a source book for the latest findings on climate change

The Unpartizan Review

For many students with no science background, environmental geology may be one of the only science courses they ever take. *Living With Earth: An Introduction to Environmental Geology* is ideal for those students, fostering a better understanding of how they interact with Earth and how their actions can affect Earth's environmental health. The informal, reader-friendly presentation is organized around a few unifying perspectives: how the various Earth systems interact with one another; how Earth affects people (creating hazards but also providing essential resources); and how people affect Earth. Greater

emphasis is placed on environment and sustainability than on geology, unlike other texts on the subject. Essential scientific foundations are presented - but the ultimate goal is to connect students proactively to their role as stakeholders in Earth's future.

THE CHANGING EARTH: EXPLORING GEOLOGY AND EVOLUTION, Seventh Edition, is a member of a rare breed of texts written specifically for courses covering both physical and historical geology. Three interrelated themes (plate tectonics, organic evolution, and geologic time) help students understand that Earth is a complex, integrated, and continually changing system. In the new edition authors James S. Monroe and Reed Wicander integrate new content emphasizing the economic impacts of geology. Topics such as fracking,

nuclear waste, and the threat of earthquakes are covered in new Geo-Impact boxes that stress real-world applications.

Lauded for their clear writing style, the authors go beyond simply explaining geology and its processes; rather, they place that knowledge within the context of human experience by consistently emphasizing relevance, resources, and the environment. New Global Geoscience Watch activities help students learn how to use an extensive database of articles on geology that are updated several times a day and are available exclusively for users of this book.

This textbook for first year university studies gives a comprehensive review of

geomorphology. It stresses the importance of the theory of tectonic and climatic changes on a global scale and so takes account of the two revolutions which are occurring in the Earth Sciences at the present time. The book has three main parts. In the first, global tectonics is used as the framework for discussion of the Earth's major relief features, their development and structure, and the landforms resulting from tectonism. The second part is concerned with the nature of geomorphic resistance and of the processes of weathering, erosion and deposition. In the final part the significance of and evidence for, climatic change and long-term evolution of landforms are discussed, and the evidence for the impact of climate and climatic change upon the major bioclimatic zones of the continents is reviewed. The author conveys his interesting and original material in a lively and informative way. His clear and straightforward style, together with the liberal number of illustrations, should make the material accessible to all students

who wish to have an understanding of landforms through an analysis of their relation to structural, tectonic and earth surface processes.

"Given the sheer scale of the topic under consideration here, Professor Gregory does well to condense it into bite-size pieces for the reader. I recommend this text to all undergraduate students of physical geography and earth sciences, particularly to those in their first and second years... This book is a comprehensive and

(crucially) inexpensive text that will provide students with a useful source on geomorphology." - Lynda York, *The Geographical Journal* "I would highly recommend this to anyone doing geology or geography at university as a 'go to' book for geomorphology and landform." - Sara Falcone, *Teaching Earth Science* "An excellent source of information for anyone who needs a well-informed, easy to use reference volume to introduce them to the fascinating complexities of the earth's land surface, past, present and future." - Angela Gurnell, *Queen Mary, University of London* This introductory text details the land surface of the earth in a readable style covering the major issues, key themes and sensitivities of the environments/landscape.

Emphasising the major ideas and their development, each chapter includes case studies and details of influential scientists (not necessarily geomorphologists) who have contributed to the progress of understanding. Providing a very clear explanation of the understanding achieved and of the debates that have arisen, the book is comprised of 12 chapters in four sections: Visualising the land surface explains and explores the composition of the land surface and outlines how it has been studied. Dynamics of the land surface considers the dynamics affecting the earth's land surface including its influences, processes and the changes that have occurred. Environments of the land surface looks to understand the land surface in major world regions highlighting differences between the areas. Management of the land surface is an examination of the current and future prospects of the management of the earth's land surface. With pedagogical features including further reading, questions for discussion and a glossary, this original, lively text is authored by one of the leading experts in the field and will be core reading for first and second year undergraduates on all physical geography courses.

Earth's Changing Surface At the XXIV General Assembly of the International Union of Geodesy and Geophysics (IUGG), held July 2-13, 2007 in Perugia, Italy, the

International Association of Geodesy (IAG) also had its quadrennial General Assembly. The IAG - organized and contributed to several Union Symposia, as well as to Joint Symposia with other Associations. It also organized several Symposia of its own, one dedicated to each of its four Commissions and the other dedicated to the Global Geodetic Observing System (GGOS). This volume contains the proceedings of these several Symposia, which are listed below:

Symposium GS001: Reference Frames
 Convener: H. Drewes Co-convener: A. Dermanis

Symposium GS002: Gravity Field
 Convener: C. Jekeli Co-convener: U. Marti, S. Okubo, N. Sneeuw, I. Tziavos, G. Vergos, M. Vermeer, P. Visser

Symposium GS003: Earth Rotation and Geodynamics
 Convener: V. Dehant Co-convener: Chengli Huang

Symposium GS004: Positioning and Applications
 Convener: C. Rizos Co-convener: S. Verhagen

Symposium GS005: The Global Geodetic Observing System (GGOS)
 Convener: M. Rothacher Co-convener: R. Neilan, H.-P. Plag

The Symposia were organized based on the structure of the IAG (i. e., one per Commission) and covered the three pillars of geodesy, namely geometry, Earth rotation, and gravity field, plus their applications. The inclusion of the Symposium on GGOS - which is no longer a project but a major component of the IAG - integrated all geodetic areas and highlighted the importance of multidisciplinary work, and for geodetic research.

The report reviews NASA's solid-earth science strategy, placing particular emphasis on observational strategies for measuring surface deformation, high-resolution topography, surface properties, and the variability of the earth's magnetic and gravity fields. The report found that NASA is uniquely positioned to implement these observational strategies and that a number of agency programs would benefit from the resulting data. In particular, the report strongly endorses the near-term launch of a satellite dedicated to L-band InSAR measurements of the land surface, which is a key component of the U.S. Geological Survey's hazards mitigation program and the multi-agency EarthScope program.

Written by a UK-US team of leading climate scientists and reviewed by climate scientists and others, the publication is intended as a brief, readable reference document for decision makers, policy makers, educators, and other individuals seeking authoritative information on the some of the questions that continue to be asked. Climate Change makes clear what is well-established and where understanding is still developing. It echoes and builds upon the long history of climate-related work from both national academies, as well as on the newest climate-change

assessment from the United Nations' Intergovernmental Panel on Climate Change. It touches on current areas of active debate and ongoing research, such as the link between ocean heat content and the rate of warming.
